# 1 Declaration of conformity

**EC Declaration of Conformity**

**Description** 520/620 Liquid filling pump

**Products** 520Di or 620Di  
520DiN or 620DiN

**Conformity** Watson-Marlow Ltd declares that when this pump unit is used as a stand-alone pump it complies with Machinery Directive 2006/42/EC.

**Standards** Watson-Marlow Limited declares that the above stated products are in conformance with the following harmonised standards and directives:

- Low Voltage Directive 2006/95/EC,
- Safety of Machinery-Electrical equipment of machines; BS EN 60204-1
- Safety requirements for electrical equipment for measurement, control and laboratory use; BS EN 61010-1 IEC 61010-1 UL 61010-1
- Safety of machinery-Basic concepts, general principals of design BS EN ISO 12100-1 and BS EN ISO 12100-2
- Degrees of protection provided by enclosures (IP code) BS EN 60529
- Digital Data Communication BS EN 61138-2
- Conducted emissions BS EN 55011 Class A
- Radiated emissions BS EN 55011 Class A
- Electrostatic discharge immunity BS EN 61000-4-2
- Radiated RF immunity BS EN 61000-4-3
- Fast transient/burst immunity BS EN 61000-4-4
- Surge immunity testing BS EN 61000-4-5
- Conducted RF immunity BS EN 61000-4-6
- Voltage dips and interruptions BS EN 61000-4-11
- Mains harmonics BS EN 61000-3-2

**Manufacturer** Watson-Marlow Limited, TR11 4RU, England

**Date** 24 April 2013

**Signature**

David Cole, Managing Director, Watson-Marlow Limited
2 Declaration of incorporation

Declaration of Incorporation

Watson-Marlow Ltd
Falmouth
Cornwall
TR11 4BU
England

In accordance with the Machinery Directive 2006/42/EC that if this unit is to be installed into a machine or is to be assembled with other machines for installations, it shall not be put into service until the relevant machinery has been declared in conformity.

We hereby declare that:

Peristaltic Pump
Series: Flexicon liquid filling pump

that the following harmonized standards have been applied and fulfilled for health and safety requirements:

Safety of Machinery - EN ISO 12100
Safety of Machinery – Electrical Equipment of Machines EN 60204-1.
Quality Management System - ISO 9001.

and the technical documentation is compiled in accordance with Annex VII(B) of the Directive.

We undertake to transmit, in response to a reasoned request by the appropriate national authorities, relevant information on the partly completed machinery identified above. The method of transmission shall be by mail or email.

The pump head is incomplete and must not be put into service until the machinery into which it is to be incorporated has been declared in conformity with the provisions of the Directive.

Person authorized to compile the technical documents:

Andrew Green
........................................ of Watson-Marlow Ltd.

Place and date of declaration: Watson-Marlow Ltd, 24 August 2013

Responsible person:

Mr. David Cole
Managing Director for Watson-Marlow Ltd
# 3 Five-year warranty

## 520 cased pumps, 620 cased pumps and 720 cased pumps

For any 520, 620 or 720 cased pump purchased after 1 January 2007, Watson-Marlow Limited ("Watson-Marlow") warrants, subject to the conditions and exceptions below, through either Watson-Marlow, its subsidiaries, or its authorised distributors, to repair or replace free of charge, any part of the product which fails within five years of the day of manufacture of the product. Such failure must have occurred because of defect in material or workmanship and not as a result of operation of the product other than in normal operation as defined in this pump manual.

Flexicon shall not be liable for any loss, damage, or expense directly or indirectly related to or arising out of the use of its products, including damage or injury caused to other products, machinery, buildings, or property, and Watson-Marlow shall not be liable for consequential damages, including, without limitation, lost profits, loss of time, inconvenience, loss of product being pumped, and loss of production. This warranty does not obligate Watson-Marlow to bear any costs of removal, installation, transportation, or other charges which may arise in connection with a warranty claim.

Conditions of and specific exceptions to the above warranty are:

## Conditions
- Products must be returned by pre-arrangement, carriage-paid, to Watson-Marlow, or a Watson-Marlow approved service centre.
- All repairs or modifications must have been made by Watson-Marlow Limited, or a Watson-Marlow approved service centre or with the express permission of Watson-Marlow.
- Warranties purporting to be on behalf of Watson-Marlow made by any person, including representatives of Watson-Marlow, its subsidiaries, or its distributors, which do not accord with the terms of this warranty shall not be binding upon Flexicon unless expressly approved in writing by a Director or Manager of Flexicon.

## Exceptions
- The warranty shall not apply to repairs or service necessitated by normal wear and tear or for lack of reasonable and proper maintenance.
- All tubing and pumping elements as consumable items are excluded.
- Products which, in the judgment of Watson-Marlow, have been abused, misused, or subjected to malicious or accidental damage or neglect are excluded.
- Electrical surge as a cause of failure is excluded.
- Chemical attack is excluded
- All pumphead rollers are excluded.
- The 620R family of pumpheads are excluded from all warranty when pumping above 2 bar while above 165rpm.
- Pumpheads from the 313/314 and the Microcassette ranges and any 701 extension pumpheads are excluded and retain their one-year standard pumphead warranty. The drive they are attached to is subject to the five-year warranty as set out here.
- Ancillaries such as leak detectors are excluded.
4 When you unpack your pump

Unpack all parts carefully, retaining the packaging until you are sure all components are present and in good order. Check against the components supplied list, below.

Packaging disposal

Dispose of packaging materials safely, and in accordance with regulations in your area. The outer carton is made of corrugated cardboard and can be recycled.

Inspection

Check that all components are present. Inspect components for damage in transit. If anything is missing or damaged, contact your distributor immediately.

Components supplied

620Di and 620DiN pumps are available in two forms, dedicated to either 620R series pumpheads or 620L series pumpheads. Pumps are supplied as:

- Dedicated 620R pump drive unit fitted with 620R, 620RE or 620RE4 pumphead (see 8. Pump specifications); OR: Dedicated 620L pump drive unit fitted with 620L or 620LG pumphead (see 8. Pump specifications)
- A 620N module providing pump ingress protection to IP66, NEMA 4X, if a 620DuN.  
  **Note:** the module is attached for transit, but must be removed to allow wiring up, voltage selection and fuse inspection and then re-affixed before the pump is operated.
- The designated mains power lead for your pump
- PC-readable CDROM containing these operating instructions
- Quick Start manual

Note: Some versions of this product will include components different from those listed above. Check against your purchase order.

Storage

This product has an extended shelf life. However, care should be taken after storage to ensure that all parts function correctly. Users should be aware that the pump contains a battery with an unused life of seven years. Long-term storage is not recommended for peristaltic pump tubing. Please observe the storage recommendations and use-by dates which apply to tubing you may wish to bring into service after storage.

5 Information for returning pumps

Equipment which has been contaminated with, or exposed to, body fluids, toxic chemicals or any other substance hazardous to health must be decontaminated before it is returned to Watson-Marlow or its distributor.

A certificate included at the rear of these operating instructions, or signed statement, must be attached to the outside of the shipping carton. This certificate is required even if the pump is unused.

If the pump has been used, the fluids that have been in contact with the pump and the cleaning procedure must be specified along with a statement that the equipment has been decontaminated.
6 Peristaltic pumps - an overview

Peristaltic pumps are the simplest pump, with no valves, seals or glands to clog or corrode. The fluid contacts only the bore of a tube, eliminating the risk of the pump contaminating the fluid, or the fluid contaminating the pump. Peristaltic pumps can run dry.

How they work

A compressible tube is squeezed between a roller and a track on an arc of a circle, creating a seal at the point of contact. As the roller advances along the tube, the seal also advances. After the roller has passed, the tube returns to its original shape, creating a partial vacuum which is filled by fluid drawn from the inlet port.

Before the roller reaches the end of the track, a second roller compresses the tube at the start of the track, isolating a packet of fluid between the compression points. As the first roller leaves the track, the second continues to advance, expelling the packet of fluid through the pump’s discharge port. At the same time, a new partial vacuum is created behind the second roller into which more fluid is drawn from the inlet port.

Backflow and siphoning do not occur, and the pump effectively seals the tube when it is inactive. No valves are needed.

The principle may be demonstrated by squeezing a soft tube between thumb and finger and sliding it along: fluid is expelled from one end of the tube while more is drawn in at the other.

Animal digestive tracts function in a similar way.

Suitable applications

Peristaltic pumping is ideal for most fluids, including viscous, shear-sensitive, corrosive and abrasive fluids, and those containing suspended solids. They are especially useful for pumping operations where hygiene is important.

Peristaltic pumps operate on the positive displacement principle. They are particularly suitable for metering, dosing and dispensing applications. Pumps are easy to install, simple to operate and inexpensive to maintain.
7 Safety notes

In the interests of safety, this pump and the tubing selected should only be used by competent, suitably trained personnel after they have read and understood this manual, and considered any hazard involved. If the pump is used in a manner not specified by Watson-Marlow Ltd, the protection provided by the pump may be impaired.

Any person who is involved in the installation or periodic maintenance of this equipment should be suitably skilled or instructed and supervised using a safe system of work. In the UK this person should also be familiar with the Health and Safety at Work Act 1974.

- **This symbol, used on the pump and in this manual, means: Caution, risk of electric shock.**

- **This symbol, used on the pump and in this manual, means: Caution, refer to accompanying documents.**

- **This symbol, used on the pump and in this manual, means: Do not allow fingers to contact moving parts.**

- **This symbol, used on the pump and in this manual, means: Recycle this product under the terms of the EU Waste Electrical and Electronic Equipment (WEEE) Directive.**

There is a user-replaceable type T5A H 250V fuse in the fuseholder in the centre of the switchplate at the back of the pump. The 620N module must be removed, if a 620DiN, to allow access to the switchplate. See 20.1 620N module removal and replacement. There are thermal fuses within the pump which self-reset within 60 seconds; if they trip an error code is displayed. This pump contains no user-serviceable fuses or parts.

- **Fundamental work with regard to lifting, transportation, installation, starting-up, maintenance and repair should be performed by qualified personnel only. The unit must be isolated from mains power while work is being carried out.**
There are moving parts inside the pumphead. Before opening the tool-unlockable pumphead guard, ensure that the following safety directions are followed.

- Ensure that the pump is isolated from the mains power.
- Ensure that there is no pressure in the pipeline.
- If a tube failure has occurred, ensure that any fluid in the pumphead has been allowed to drain to a suitable vessel, container or drain.
- Ensure that protective clothing and eye protection are worn if hazardous fluids are pumped.
- Primary operator protection from rotating parts of the pump is provided by the pumphead safeguard. Note that safeguards differ, depending on the type of pumphead. See the pumphead sections of this manual, 27 and 31.
- Secondary operator protection from rotating parts of the pump is provided by electrical interlocking of the pumphead guard. This function will stop the pump if the guard is inadvertently opened while the pump is running. For details of permissible pumphead orientations, see the pumphead sections of this manual, 27 and 31.

This pump must be used only for its intended purpose. The pump must be accessible at all times to facilitate operation and maintenance. Access points must not be obstructed or blocked. The pump’s mains plug is the disconnecting device (for isolating the motor drive from the mains supply in an emergency). Do not position the pump so that it is difficult to disconnect the mains plug. Do not fit any devices to the drive unit other than those tested and approved by Watson-Marlow. Doing so could lead to injury to persons or damage to property for which no liability can be accepted.

This product does not comply with the ATEX directive and must not be used in explosive atmospheres.

If hazardous fluids are to be pumped, safety procedures specific to the particular fluid and application must be put in place to protect against injury to persons.

The exterior surfaces of the pump may get hot during operation. Do not take hold of the pump while it is running. Let it cool after use before handling it.

No attempt should me made to run the drive without a pumphead fitted.

The pump weighs more than 18kg (the exact weight depends on model and pumphead—see 8 Pump specifications). Lifting should be performed according to standard Health and Safety guidelines. Finger recesses are built into the sides of the lower shell for convenience in lifting; in addition, the pump can conveniently be lifted by grasping the pumphead and (where fitted) the 620N module at the rear of the pump.
8 Pump specifications

Labels fixed to the rear of the pump contain manufacturer and contact details, product reference number, serial number and model details.

The same information is carried on the drive’s backplate, accessible when the 620N module is removed. The picture below is how a 620Di looks from the box. The number of connectors varies according to the model.

620DiN, IP66 NEMA 4X model

This pump can be controlled from the keypad or remotely. It features:

**Manual control**
- Speed adjustment; run and stop; direction control; "max" key for rapid priming.

**Remote control**
- The pump can be digitally controlled with a contact closure or logic input signal to operate the pump.

**Outputs**
- There are four 24V relay status outputs which can be configured in software for a variety of pump parameters

**Calibration**
- Full calibration, plus default figures for a range of pumpheads and tubes.
RS485 serial communications
Full pump control from a PC or other controller with the ability to network up to 32 pumps. **Computer recording of dispensed batches is not possible under RS485.**

Dispensing feature
Batch or single-dose dispensing, including dose size and number, interval, start and end ramp and drip control.

Guard switch
Primary operator protection from rotating parts of the pump is provided by the fixed guard. Secondary operator protection from rotating parts of the pump is provided by indicator-only switching of the pumphead guard.

PIN-secure process protection
Two levels of control protection: main PIN code and user PIN code.

### 620Di, IP31 model

This pump can be controlled from the keypad or remotely. It features:

**Manual control**
- Speed adjustment; run and stop; direction control; "max" key for rapid priming.

**Remote control**
- The pump can be digitally controlled with a contact closure or logic input signal to operate the pump.

**Outputs**
- There are four 24V relay status outputs which can be configured in software for a variety of pump parameters.

**Calibration**
- Full calibration, plus default figures for a range of pumpheads and tubes.

**RS232 serial communications**
- Full pump control from a PC or other controller with the ability to network up to 32 pumps. **A computer can be connected to the pump to make (and print) records of dispensed batches.**

**Dispensing feature**
- Batch or single-dose dispensing, including dose size and number, interval, start and end ramp and drip control.

**Guard switch**
- Primary operator protection from rotating parts of the pump is provided by the fixed guard. Secondary operator protection from rotating parts of the pump is provided by indicator-only switching of the pumphead guard.

**PIN-secure process protection**
- Two levels of control protection: main PIN code and user PIN code.

8.1 Pressure capability

This pump’s default running speed is 165rpm. It can be run at any speed up to 265rpm. Please note, however:

- **The 620RE and 620RE4 rotor warranty is limited to 2 bar from 165rpm to 265rpm.**
- A warning is displayed when the user sets the speed above 165rpm. **Note:** Applies to 620RE MarkII and 620RE4 MarkII pumpheads only. (The 620LG is not limited).
- The pump’s software records the duration of operation above 165rpm.
8.2 Dimensions
9 Good pump installation practice

9.1 General recommendations

Position

A correctly engineered installation will promote long tube life. Site the pump on a flat, horizontal, rigid surface, free from excessive vibration, to ensure correct lubrication of the gearbox. Allow a flow of air around the pump to ensure that heat can be dissipated. Ensure that the temperature around the pump does not exceed 40°C.

Do not stack other 620 pumps on top of this pump. It is, however, acceptable to stack other equipment on the upper surface of the 620 (as long as the ambient temperature does not exceed 40°C).

Emergency disconnection

The pump’s mains plug is the disconnecting device (for isolating the motor drive from the mains supply in an emergency). Do not position the pump so that it is difficult to disconnect the mains plug. The STOP key on the keypad will always stop the pump. However, it is recommended that a suitable local emergency stop device is fitted into the mains supply to the pump.

Valves

Peristaltic pumps are self-priming and self-sealing against backflow. No valves are required in inlet or discharge lines. Valves in the process flow must be opened before the pump operates. Users are advised to fit a pressure relief device between the pump and any valve on the discharge side of the pump to protect against damage caused by accidental operation with the discharge valve closed.

The pump may be set up so that the direction of rotor rotation is clockwise or counter-clockwise, whichever is convenient.

Tubing materials: run-in advice

Sta-Pure and Marprene TM tubing are hard to compress when new. When using tubing made of these materials, the first five pumphead revolutions should be at a speed of 10 rpm or greater. If the pump is run slower, the safety system built into pump drive’s software may cause it to stop and display an over-current error message.

Pressure advice

In most circumstances, rotor and tube life are maximised if the pumphead is run slowly, particularly when pumping at high pressure. However, to maintain performance at pressures above 2 bar, avoid running the pumphead below 50 rpm. If low-flow, high-pressure operation is necessary, switching to a smaller tube is recommended.
9.2 Do’s and do not’s

**Do not** build a pump into a tight location without adequate airflow around the pump.

**Do** ensure that when the 620N watertight module is fitted the seals are intact and properly located. Ensure that the holes for cable glands are properly sealed to maintain the IP66 / NEMA 4X rating.

**Do not** strap the control and mains power cables together.

**Do** keep delivery and suction tubes as short and direct as possible – though ideally not shorter than 1m – and follow the straightest route. Use bends of large radius: at least four times the tubing diameter. Ensure that connecting pipework and fittings are suitably rated to handle the predicted pipeline pressure. Avoid pipe reducers and lengths of smaller bore tubing than the pumphead section, particularly in pipelines on the suction side. Any valves in the pipeline (not usually needed) must not restrict the flow. Any valves in the flow line must be open when the pump is running.

**Do** use suction and delivery pipes equal to or larger than the bore of the tube in the pumphead. When pumping viscous fluids use pipe runs with a bore several times larger than the pump tube.

**Do** ensure that on longer tube runs at least 1m of smooth bore flexible tubing is connected to the inlet and discharge port of the pumphead to help to minimize impulse losses and pulsation in the pipeline. This is especially important with viscous fluids and when connecting to rigid pipework.

**Do** site the pump at or just below the level of the fluid to be pumped if possible. This will ensure flooded suction and maximum pumping efficiency.

**Do** run at slow speed when pumping viscous fluids (though see Pressure advice in 9.1 General recommendations). Flooded suction will enhance pumping performance in all cases, particularly for materials of a viscous nature.

**Do** recalibrate after changing pump tubes, fluid, or any connecting pipework. It is also recommended that the pump is recalibrated periodically to maintain accuracy.

**IP66 / NEMA 4X** models may be hosed down, but should not be immersed. Protect from prolonged UV exposure.

**IP31** models may be wiped with a damp cloth, but should not be hosed or immersed. The front of IP31 models is further protected against light spillages onto the pump.

**When using Marprene or Bioprene** continuous tubing, do re-tension the tube after the first 30 minutes of running.

**Tube selection:** The chemical compatibility lists published in Watson-Marlow publications are guides. If in doubt about the compatibility of a tube material and the duty fluid, request a Watson-Marlow tube sample card for immersion trials.
10 Connecting this product to a power supply

A well regulated electrical mains supply is required along with cable connections conforming to the best practice of noise immunity. It is not recommended to site these drives alongside “dirty” electrical mains supplies such as 3-phase contactors and inductive heaters without special attention being paid to unacceptable mains-borne noise.

The voltage selector is mounted in the switchplate at the rear of the pump, protected from water by the 620N module (620DuN). The module must be removed to allow access to the switchplate. See 20.1 620N module removal and replacement. Set the voltage selector to 115V for 100-120V 50/60Hz supplies or 230V for 200-240V 50/60Hz supplies. Always check the voltage selector switch before connecting the mains supply. Make suitable connection to an earthed, single-phase mains electricity supply.

We recommend using commercially available supply voltage surge suppression where there is excessive electrical noise.

Power cable: The pump is supplied fitted with either of two cable glands and approximately 2.8m of power cable. The European cable is to Harmonised code H05RN-F3G0.75, used with our gland part number SL0128 which is suitable for an outside cable sheath diameter of 4-7mm. The north American cable is to type SJTOW 105C 3-18AWG VW-1 used with our gland part number SL0123 which is suitable for an outside cable sheath diameter of 7-9mm.

Power cables of NEMA 4X specification pumps are fitted with a standard US mains power plug. IP66 specification pumps are supplied with no plug. Wiring a mains plug must only be undertaken by suitably skilled, qualified personnel.

The voltage selector switch is not visible while the 620N module is in place. Do not switch the pump on unless you have checked that it is set to suit your power supply by removing the module and inspecting the switch, and then refitting the module. See 20.1 620N module removal and replacement.

If the mains power cable is inappropriate for your installation, it can be changed. Please contact your local Flexicon service centre.
Input line fusing: type T5A H 250V 20mm time-delayed cartridge fuse, located in a fuseholder in the centre of the switchplate at the rear of the pump.

Power interruption: This pump has an auto-restart feature which, when active, will restore the pump to the operating state it was in when power was lost. See 19.12 Auto-restart.

Stop / start power cycles: Do not power up/power down for more than 100 starts per hour, whether manually or by means of the auto-restart facility. We recommend remote control where a high number of starts is required.

11 Start-up check list

Note: See also 27.6, 27.7, 27.8 and 31.5, Tube loading.

- Ensure that proper connections are achieved between the pump tube and suction and discharge piping.
- Ensure proper connection has been made to a suitable power supply.
- Ensure that the recommendations in section 9. Good pump installation practice are followed.

12 Switching the pump on for the first time

Note: This manual uses bold type to highlight the active option in menu screens: “English” in the first screen represented here. The active option appears on the pump display in inverse text.

- Switch on the power supply at the rear of the pump. The pump runs a power-on test to confirm proper functioning of the memory and hardware. If a fault is found, an error message is displayed. See 24.1 Error codes.
- The pump displays a language menu. Use the UP and DOWN keys to select your language. Press the ENTER key to confirm your choice.
- The information which follows assumes that your choice was English.
• When the language is chosen this menu will not appear again and all menus will appear in the language you chose. (Language can be reset as described later. See 19.19 Language.)
• The pump displays the Flexicon start-up screen for four seconds, followed by the pump model identity screen for four seconds (an example is shown here), and then the main menu.
• The rotation symbol on the display indicates clockwise rotation. The default speed setting is 165rpm, but 265rpm is available (see 19.13 Set maximum allowed speed). Other initial start-up operational parameters are listed in the table below.

620DiN, 620Di: First-time start-up defaults

Note: The settings shown above for Run, Clockwise rotation and Auto are those in force on initial start-up for the functions available on Output 1, Output 2 and Output 3 respectively. For example, a high signal on Output 2 indicates clockwise rotation. These can be exchanged later according to user requirements.

Note: High is equivalent to the common and normally open contacts of the relay on the adapter board being closed.

The pump is now ready to operate according to the defaults listed above.

All operating parameters may be changed by means of key-presses. See 14. Manual operation.
13 Switching the pump on in subsequent power cycles (if not in auto-restart mode)

- Switch on the power supply at the rear of the pump. The pump runs a power-on test to confirm proper functioning of the memory and hardware. If a fault is found, an error message is displayed. See 24.1 Error codes.
- The pump displays the Flexicon start-up screen for four seconds followed by the pump model identity screen for four seconds, and then the main menu.
- Start-up defaults are those in place when the pump was switched off last. Check that the pump is set to operate as you require it.

The pump is now ready to operate.

All operating parameters may be changed by means of key-presses. See 14 Manual operation below.
14 Manual operation

14.1 Keypad functions

All settings and functions of the pump in manual mode are set and controlled by means of key-presses. Immediately after the start-up display sequence detailed above, the manual mode main screen will be displayed. The currently selected rotation direction is indicated on the display by a clockwise or counter-clockwise segmented arrow. If an exclamation mark (!) shows, it indicates that Auto-restart is on. If a padlock icon (🔒) shows, it indicates that Keypad lock is on.

Note: A number of the controls listed below are shortcuts to commands which are also available through the Main menu. See 15 Main menu.

Note: SHIFT gives access to functions which appear on the upper part of numeric keys. To access the MAX function, for example, press SHIFT once and release it. A symbol appears in the bottom left of the display to indicate that the next keypress will be SHIFTed. Press 4 (MAX).

A brief single press on each key triggers a beep sound (if enabled - see 14.5 Keypad beep) and causes the pump to function as follows:

- **START**: starts the pump at the speed and in the direction shown on the display. The rotation symbol will become animated to confirm that the pump is operating.

  ![Start Example](image)

  If the pump is running when **START** is pressed, it causes the information shown on the manual mode main screen to cycle from revolutions per minute, to flowrate in a choice of units (via a warning screen if flowrate has not been calibrated and if this is the first cycle since power-up) to rpm and flowrate. An example is shown here. The default can be altered from within the Setup menu (see 19.2 Display).

- **MAX (SHIFT, 4)**: while pressed, **MAX (SHIFT, 4)** operates the pump at the maximum allowed speed and in the direction shown on the display. When released, the pump returns to its previous status.
  
  **Note**: Priming can be achieved by pressing **MAX (SHIFT, 4)** until fluid flows through the pump and reaches the point of discharge, and then releasing **MAX (SHIFT, 4)**.
- **INFO (SHIFT, 9):** causes the pump to display the volume of fluid it has dispensed since being set to zero or calibrated. **SHIFT, 9 (INFO)** causes the pump to display the volume of fluid it has dispensed since being set to zero or calibrated. The information is displayed only while **SHIFT, 9 (INFO)** is pressed and held. If **STOP** is pressed while the information screen is displayed, the volume dispensed figure is reset to zero.

- **LOAD (SHIFT, 6):** when the pump is stopped, allows the recall of a dose program from the pump’s memory. Has no effect if no program has been stored. Has no effect in Network, Calibration and Setup modes, nor if a numeric entry is called for, a dose parameter is being modified, a program is being saved or if a dose is running.

- **STOP:** if the pump is running, pressing **STOP** stops the pump. The display will continue to show the previous speed and direction. The pump will return to this speed and direction when the **START** key is pressed again.

- **UP:** increases the speed shown on the display in minimum steps of 0.1rpm, or other steps as pre-selected in the Scrolling section of Setup (18.15), (unless the speed displayed is already the maximum allowed speed). If the pump is then started by pressing the **START** key, it will operate at the new speed. If the pump is running when **UP** in pressed, the change takes effect immediately.

  **Note:** If the pump’s flow rate has been calibrated (see 18 Calibrate), after a speed change a screen showing the new rpm figure and the new flowrate is displayed for four seconds before returning the user to the previously set manual mode main screen: rpm or flowrate.

- **DOWN:** decreases the speed shown on the display in minimum steps of 0.1rpm, or other steps as pre-selected in the Scrolling section of Setup (18.15). If the pump is then started by pressing the **START** key, it operates at the new speed. The minimum speed possible is 0.1rpm. If the pump is running when **DOWN** is pressed, the change takes effect immediately.

  **Note:** If the pump’s flow rate has been calibrated (see 18 Calibrate), after a speed change a screen showing the new rpm figure and the new flowrate is displayed for four seconds before returning the user to the previously set manual mode main screen: rpm or flowrate.

  **Note:** You can reduce the pump speed from 0.1rpm (or any other minimum displayed unit of speed as selected in the Scrolling section of Setup (19.15)) to 0rpm by a further press on the **DOWN** key. The pump is still in the running state and the rotation symbol will continue to move. Press the **UP** key to return the pump to the minimum speed.

  **Note:** If a minimum allowed speed has been set in the Set Min Speed section of the Setup menu, the above note on speed reduction to 0rpm does not apply.

- **DIRECTION (SHIFT, 1):** toggles the direction of rotation shown on the display. If the pump is then started by pressing the **START** key, it rotates in the new direction. If the pump is running when **DIRECTION** is pressed, the change takes effect immediately.

- **ENTER:** is used to enter/confirm numeric and menu selections. Also cycles the information shown on the manual mode main screen exactly as **START** does, whether the pump is running or not. See **START**, above.

- **MENU (SHIFT, 7):** causes the main menu to be displayed, from which all aspects of pump setup can be controlled. See 15 Main menu.

- **CLEAR (SHIFT, 5):** clears numeric entries so that they can be entered again.

- **CAL (SHIFT, 8):** takes the user to the calibrate sequence.

- **. (decimal point, period) (SHIFT, 0):** used in numeric expressions as a decimal point. To enter 5.3, press 5, **SHIFT, 0, 3.** (Some languages use , (comma) to represent a decimal point. This pump uses .)
Keypress combinations cause the pump to function as follows:

**Note**: A number of the controls listed below are shortcuts to commands which are also available through the Main menu. See 15 Main menu.

- **UP** and **1 (DIRECTION)** on power-up: toggles the keypad beep on and off.
- **START** on power-up: switches on the Auto-restart facility. See 19.12 Auto-restart.
- **STOP** on power-up: switches off the Auto-restart facility. See 19.12 Auto-restart.
- **STOP** and **UP** while the pump is stopped: turns the display backlight on.
- **STOP** and **DOWN** while the pump is stopped: turns the display backlight off.
- **SHIFT** and **UP**: sets the pump to maximum allowed speed. **Note**: Unlike its action elsewhere, **SHIFT** must be pressed and held. **Note**: The **MAX** key has a similar function, but causes the pump to run at maximum allowed speed only while the key is pressed.
- **SHIFT** and **DOWN**: sets the pump to minimum allowed speed. **Note**: Unlike its action elsewhere, **SHIFT** must be pressed and held.
- **1 (DIRECTION)** and **DOWN**, pressed simultaneously: interrupts the display to show the pump’s ROM version for four seconds.
- **START** pressed and held for four seconds: toggles the keypad lock on and off. Only the **START** and **STOP** keys are active when keypad lock is on. The padlock icon is displayed.
- **STOP** pressed and held for two seconds: toggles the keypad lock on and off. Only the **START** and **STOP** keys are active when keypad lock is on. The padlock icon is displayed.

### 14.2 Speed

To change the running speed:

- Use the **UP** and **DOWN** keys to change the pump’s running speed within limits of 0.1 rpm or other minimum allowed speed and the maximum allowed speed. **Note**: You can reduce the pump speed from 0.1 rpm to 0 rpm by a further press on the **DOWN** key. The pump is still in the running state and the rotation symbol will continue to move. Press the **UP** key to return the pump to the minimum speed.

**Note**: The maximum allowed speed of the drive defaults to 165rpm. It is possible to set this limit at any speed up to 265rpm. See 19.13 Set maximum allowed speed, and section 3 Five-year warranty.

### 14.3 Direction

To toggle the pump’s rotation sense:

- Press **DIRECTION (SHIFT, 1)** to toggle the pump between clockwise and counter-clockwise rotation. **Note**: Direction control is available subject to access not being limited by security code. See 19.22 Security code.
14.4 Keypad lock

The keypad can be locked to prevent changes to pump speed or other settings, and make it possible only to start or stop the pump. The padlock symbol shows on the display.

- While the pump is running, hold down the **START** key for two seconds. The padlock symbol shows and only the **START** and **STOP** keys function.
- The keypad may also be locked while the pump is stopped. Hold down the **STOP** key for two seconds. The padlock symbol shows and only the **START** and **STOP** keys function.
- To unlock the keypad while the pump is running hold down the **START** key for two seconds. The padlock symbol is removed. If the pump is stopped hold down the **STOP** key until the padlock symbol is removed.

**Note:** Keypad lock is available subject to access not being limited by security code. See 19.22 Security code.

14.5 Keypad beep

The pump keypad can operate silently or indicate a positive key-press with a beep sound.

- To toggle the sound on and off, stop the pump. Turn off the mains power switch at the rear of the pump.
- Depress the **UP** and **1 (DIRECTION)** keys while switching on the mains power switch at the rear of the pump.

See 19.21 Beep.

14.6 Manual operation and remote digital inputs and outputs

The remote run/stop, direction and leak-detected inputs are operational.

The remote status outputs are all fully functional.

The **STOP** key acts as an emergency stop. The run/stop input will not start the pump in manual mode, but once the **START** key has been pressed, the remote run/stop input will stop and start the pump according to its operational state.

**(620DiN)** If you invert the operation of the remote run/stop switch to operate as open=stop, you must connect the +5V terminal to the i/p terminal on the Run/stop input connector (J4), to be able to start the pump from the keypad. See 20.3 Run/stop input.

**(620Di)** If you invert the operation of the remote run/stop switch to operate as open=stop, you must connect pin 7 to pin 19, lower D-connector, to be able to start the pump from the keypad. See 21.1 Run/stop input.

If **STOP** is pressed the remote run/stop switch will have no effect.

You cannot invert the polarity of the remote direction signal.
14.7 Backlight

To turn the display backlight on:

- Depress the STOP and UP keys together.

To turn the display backlight off:

- Depress the STOP and DOWN keys together.

See 19.16 Backlight.

14.8 Auto-restart

This pump offers an auto-restart feature. When active on power loss, it will restore the pump when power returns to the operating state it was in when power was lost. It does not operate when powering down in the middle of a dose; when the pump is restarted, it will await a press on the START key to begin the interrupted dose again. Auto-restart is retained while the pump is switched off. When the pump starts running look for the ! symbol on the display. This ! symbol indicates that the pump is set for auto-restart.

Do not use auto-restart for more than 100 starts per hour. We recommend remote control where a high number of starts is required.

To turn the auto-restart facility on:

- Turn off the mains power switch at the rear of the pump.
- Depress the START key while switching on the mains power switch at the rear of the pump.

To turn the auto-restart facility off:

- Turn off the mains power switch at the rear of the pump.
- Depress the STOP key while switching on the mains power switch at the rear of the pump.
15 Main menu

15.1 Keypad functions when not in manual mode

- **STOP**: While a dose is running, **STOP** pauses the current dose and stops the pump. **STOP** also functions as a "go back" key, taking the user up one menu level without making a change. During numeric entry, **STOP** clears the current value or restores it to its value on entry to that screen, allowing numeric entry to continue.

- **UP**: The **UP** key is used in menu item selection: it moves a highlight up a menu. In save program mode, it scrolls through 9-0, "space" then Z-A in a circular list.

- **DOWN**: The **DOWN** key is used in menu item selection: it moves a highlight down a menu. In save program mode, it scrolls through A-Z, "space" then 0-9 in a circular list.

- **START**: In Dose mode, the **START** key begins a dose.

- **ENTER**: The **ENTER** key functions in a similar way to the "enter" key of a personal computer: it confirms key-presses made immediately before. In menu item selection, it triggers the action or display selected from a menu using the **UP** and **DOWN** keys.

- **0, 1, 2, 3, 4, 5, 6, 7, 8, 9**: numeric keys are used to enter numbers when a screen asks for numeric input.

- **SHIFT**: Pressing the **SHIFT** key displays an arrow symbol in the lower left corner of the screen, indicating that the next keypress will be in Shift mode. Pressing the **SHIFT** key, then pressing **0, 1, 4, 5, 6, 7, 8 or 9** invokes the action indicated in yellow on those keys, and then cancels Shift mode. If the **SHIFT** key is pressed in error, Shift mode may be cancelled by a second press on the **SHIFT** key.

  - **SHIFT, 0(.)** enters a decimal point in a numeric expression. The number "10.55", for example, is entered by pressing **1, 0, SHIFT, 0, 5, 5**.

  - **SHIFT, 1 (DIRECTION)** toggles the direction of rotation shown on the display during dispense program setup. When the dispense program is started, the pump rotates in the new direction.

  - **SHIFT, 4 (MAX)** while the pump is in Manual mode or Dose mode at the dose start screen, causes the pump to re-prime itself. If **Always enabled** has been selected (see 19 Setup) it also causes the pump to prime itself in Calibrate mode and in Dose mode while the pump is stopped. It has no effect in Network or Setup modes.

  - **SHIFT, 5 (CLEAR)** during numeric entry, clears the current value or restores it to its value on entry to that screen, allowing numeric entry to continue. Has no effect in other modes.

  - **SHIFT, 6 (LOAD)** when the pump is stopped, allows the recall of a dose program from the pump's memory. Has no effect if no program has been stored. Has no effect in Network, Calibration and Setup modes, nor if a numeric entry is called for, a dose parameter is being modified, a program is being saved or if a dose is running.

  - **SHIFT, 7 (MENU)** displays the Main menu. It operates at any point in the pump's activity except when numeric entry is required or if a dose is running.

  - **SHIFT, 8 (CAL)** when the pump is stopped, begins a full calibration sequence (see 18 Calibrate). Has no effect in Setup and Network modes. While the pump is
dispensing a dose, **SHIFT, 8 (CAL)** allows a change to the dose size (within 25%) called recalibration - which will take effect on the next full dose.

**SHIFT, 9 (INFO)**
causes the pump to display the volume of fluid it has dispensed since being set to zero or calibrated. In Dose mode, **SHIFT, 9 (INFO)** causes the pump to display the volume of fluid it has dispensed since being set to zero or calibrated, and how many doses per hour it is currently achieving. In both cases, the information is displayed only while **SHIFT, 9 (INFO)** is pressed and held. If **STOP** is pressed while the information screen is displayed, the volume dispensed figure and the doses per hour figure are reset to zero.

**SHIFT, UP**
has no effect.

**SHIFT, DOWN**
has no effect.

**Note:** Confirmation screens are displayed for 4 seconds. While they are displayed, a single press on any key removes them.

### 15.2 Main menu entry

**MENU (SHIFT, 7)** displays the main menu and stops the pump if it is running in Manual mode. It operates at any point in the pump’s activity except where error screens are displayed, where **UP** and **DOWN** keys are used to enter values, or where a PIN is requested.

![1650](image)

The main menu offers five options: **Dose, Calibrate, Manual, Setup** and **Network**. Use the **UP** and **DOWN** keys to make a choice. Press the **ENTER** key to confirm your decision.

**Dose**

Except when under manual control, all pump activity is controlled by dispense programs. Selecting **Dose** allows the user to create, amend or select a dispense program, and instruct the pump to carry it out. The pump will stop if **STOP** is pressed, but is otherwise under the control of the dispense program.

**Calibrate**

Selecting **Calibrate** allows the user to calibrate the pump with default figures for a range of pumpheads and tubes, as well as to refine the flowrate figures with a calibration dose facility.

**Manual**

Selecting **Manual** allows the user to start, control and stop the pump by means of keypresses.
Network

Selecting Network places the pump under external control, using RS232 (620Di) or RS485 (620DiN) network communications.

Setup

Selecting Setup allows the user to set the pump’s operating parameters under 20 headings: Dosing, Display, Pump I/D, Baud, Stop bits, Xon/Xoff, Units, Date/time, Max, Outputs, Remote stop, Auto-restart, Set max Speed, Pin out details, Backlight, ROM, Language, Defaults, Beep, and Security code.
16 PIN-secure process protection

The 620DiN and 620Di feature PIN-secure process protection. This allows the pump to be configured to suit the application, and for the setup to be protected by two levels of PIN code.

The main code gives access to **Calibrate**, **Setup**, **Direction** change and **Keypad lock**.

The secondary (User) code permits **Calibrate**, **Direction** change and **Keypad lock** but bars **Setup** change.

If either code is used in conjunction with Keypad lock, all keys are disabled except **STOP** and **START**.

To activate and set a security code, see 19.22 Security code.

**If the main code is lost or forgotten:** The Setup main security code can be bypassed by entering a special key sequence; all codes can then be cancelled and reset. Contact Watson-Marlow Limited or your distributor for details.
17 Dose

Dose mode allows the setup, storage and use of up to 50 different dispense programs. A complete dosing sequence, with all its parameters set, can be initiated by pressing START or closing a remote switch.

The dosing parameters are: pumphead type, tube size, calibrated flow, dose size, speed and direction, pause interval, number of doses, start/end ramps and drip adjustment.

- Use the UP and DOWN keys to highlight Dose in the Main menu. Press ENTER to confirm.
- If no dispense program has been saved, the pump displays the first screen of the Set dose program sequence, via the security code entry sequence if one has been set.
- If the pump has stored one or more dose programs, the pump invites the user to set a new program or use an existing one, via the security code entry sequence if one has been set. Use the UP and DOWN keys to highlight Set new program or Load program. Press ENTER to confirm.
- If Set new program is selected, the pump displays the first screen of the Set dose program sequence.
- If Load program is selected, the pump displays the Find program screen (see 17.2 Loading a stored dispense program), via an offer to display the available programs on a personal computer if one is connected (620Di only). See 23 Connecting a computer.

Alternatively ...

Press SHIFT, 6 (LOAD) to display the Find program screen (if one or more dispense programs have been stored). This shortcut is not available if the pump is in Calibrate mode, numeric entry mode, is modifying a dose parameter, saving a program or if a dose is running.
17.1 Setting a dispense program

Default dispense program settings are:

<table>
<thead>
<tr>
<th>Pump-head</th>
<th>Tube size</th>
<th>Dose size</th>
<th>Dose interval</th>
<th>Number of doses</th>
<th>Speed</th>
<th>Direction</th>
<th>Start ramp</th>
<th>End ramp</th>
<th>Drip</th>
</tr>
</thead>
<tbody>
<tr>
<td>620L</td>
<td>9.6mm bore</td>
<td>25.0ml</td>
<td>0</td>
<td>10</td>
<td>300</td>
<td>CW</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Note: These settings will be restored if the pump is restored to factory defaults.

The Calibration section of this manual (see 18 Calibrate) lists the pumphead and tube size options available, and describes how to tell the pump’s software which pumphead and tube are in use. This section of the manual assumes that the user has already chosen his pumphead and tube, and calibrated the pump accordingly.

Setting a new dispense program is the process of changing any or all of the default settings - or of the current settings, if any have previously been changed (apart from pumphead and tube size) - and saving the changed suite of settings as a new dispense program.

The Dispense program parameters menu occupies several screens.

To move from one screen to subsequent screens, repeatedly press DOWN. Each item is highlighted in turn until the last item on the screen is highlighted. A further press on the DOWN key displays the next screen of the menu, with the first item highlighted.

Follow the reverse procedure using the UP key to move to an item on a previous screen of the menu.
Select a parameter using the UP or DOWN keys. The values shown are the default values or those set for the current dispense program. As each parameter is highlighted, you may accept or change its value.

- If it is correct, do nothing. UP and DOWN highlight the next parameter.
- If you wish to change it, do so using the keys indicated as available in the bottom line of the screen. When the value is correct, confirm by pressing ENTER (if the value is numeric) and use the UP or DOWN keys to move to the next parameter.
- At any time during the dose setup sequence the user may press START and the pump may be operated according to the parameters in force. If the next batch requires only the dose size to be changed from the last batch, for example, change it and press START, ignoring the other parameters.
- The last two items on the last screen of the menu are Save and Proceed. If the user has made all the required changes, he may save the new settings by highlighting Save using the UP or DOWN keys and pressing ENTER to confirm; or he may proceed to run the new program according to the parameters in force by highlighting Proceed using the UP or DOWN keys and pressing ENTER to confirm. The amended program will not have been saved and cannot be re-run without re-entering the changes made.

### Dose volume if the units are set to volume

See 19.7 Setup, Flow units.

- Use the UP and DOWN keys to highlight the Volume line of the display (the top line, first screen). The units shown are those chosen during the Setup sequence. See 19.7 Setup.
- If the dose volume displayed is correct, do nothing. UP and DOWN highlight the next or previous parameter.
- If you wish to change the dose volume, use the numeric keys to enter a new volume. Example figures are shown here. To quickly return to the starting value, press SHIFT, 5 (CLEAR). When the dose volume is correct, press ENTER to confirm and use the UP and DOWN keys to highlight the next parameter. DOWN is assumed here.
Dose volume if the units are set to weight

See 19.7 Setup, Flow units.

- Use the **UP** and **DOWN** keys to highlight the weight line of the display (the top line, first screen - still called Volume). The units shown are those chosen during the Setup sequence. See 19.7 Setup.
- If the dose weight displayed is correct, do nothing. **UP** and **DOWN** highlight the next or previous parameter.
- If you wish to change the dose weight, use the numeric keys to enter a new weight. Example figures are shown here. To quickly return to the starting value, press **SHIFT, 5 (CLEAR)**. When the dose weight is correct, press **ENTER** to confirm.
- The pump invites you to enter the specific gravity of the duty fluid. Use the numeric keys to do so. Press **ENTER** to confirm. The pump redisplays the first menu screen. Use the **UP** and **DOWN** keys to highlight the next parameter. **DOWN** is assumed here.

Note: The dose size must use more than 0.5 revolutions of the pumphead. To obtain best accuracy the dose size should use more than five revolutions. Where the dose size uses less than five revolutions, the pump may warn that a smaller tube size is required. If you do not change the tube size, the pump may proceed with your selected dose size but accuracy may be reduced. If the dose is smaller than the 0.5 revolution minimum, the pump displays a warning and does not allow you to proceed. Both warning screens are displayed for four seconds, unless cancelled by any keypress. If you wish to proceed with the dose size, you must perform a new pump calibration using a smaller tube size. (See 18 Calibrate).

Dose interval

- Use the **UP** and **DOWN** keys to highlight the dose Interval line of the display (the second line, first screen). The display shows the previously set time interval between doses in seconds.
- If the interval displayed is correct, do nothing. **UP** and **DOWN** highlight the next or previous parameter.
- If you wish to change the interval between doses, use the numeric keys to
enter the required interval, from 0 seconds to 999 seconds. Example figures are shown here. To quickly return to the starting value, press **SHIFT, 5 (CLEAR)**. Press **ENTER** to confirm. If you wish to change other parameters, use the **UP** and **DOWN** keys to highlight each as required. **DOWN** is assumed here.

**Note:**

- **Interval = 0 :** Discrete doses each triggered by pressing **START**, in batch or not
- **Interval > 0 :** Completes batch automatically if doses > 1. Press **START** to begin

**Number of doses**

- Use the **UP** and **DOWN** keys to highlight the **Doses** line of the display (the third line, first screen). The display shows the previously set number of doses.
- If the number displayed is correct, do nothing. **UP** and **DOWN** highlight the next or previous parameter.
- If you wish to change the number of doses, use the numeric keys to enter the required number, from 1 to 9999. Example figures are shown here. To quickly return to the starting value, press **SHIFT, 5 (CLEAR)**. Press **ENTER** to confirm. If zero is entered, a warning screen is displayed briefly and the opportunity to choose a dose number is repeated. If you wish to change other parameters, use the **UP** and **DOWN** keys to highlight each as required. **DOWN** is assumed here.

**Note:**

- **Doses = 1 :** No batch. The display counts up. Press **START** for each dose
- **Doses > 1 :** Batch. The display counts down. Press **START** to begin batch

**Pump speed or flowrate**

- Use the **UP** and **DOWN** keys to highlight the speed line of the display (the first line, second screen). The display shows the previously set pump speed OR the previously set flowrate. Flowrate is displayed if you chose **Flowrate** as the preferred units for dosing flow as part of the Setup sequence. See 19 Setup.
- If the speed or flowrate displayed is correct, do nothing. **UP** and **DOWN** highlight the next or previous parameter.
- If you wish to change the speed or flowrate, use the numeric keys to enter the required speed or flowrate. If the value selected for speed or flowrate is outside the band allowed by the information entered when the pump was calibrated, a warning is shown and you are invited to enter a new value. Alternatively, you may need to recalibrate or choose a new tube size. Example figures are shown here. To quickly return to the starting value, press **SHIFT, 5 (CLEAR)**. Press **ENTER** to confirm. If you wish to change other parameters, use the **UP** and
**DOWN** keys to highlight each as required. **DOWN** is assumed here.

**Pump direction**

- Use the **UP** and **DOWN** keys to highlight the **Direction** line of the display (the second line, second screen). The display shows the previously set direction of rotation.
- If the direction displayed is correct, do nothing. **UP** and **DOWN** highlight the next or previous parameter.
- If you wish to change the direction, press **SHIFT, 1 (DIRECTION)** to toggle the displayed direction. An example is shown here.
  **Note**: The direction icon at the lower right corner of the display screen also changes.
- If you wish to change other parameters, use the **UP** and **DOWN** keys to highlight each as required. **DOWN** is assumed here.

**Alternatively ...**

Press **SHIFT, 1 (DIRECTION)** at any point in the menu sequence.

**Start ramp**

- Use the **UP** and **DOWN** keys to highlight the **Start ramp** line of the display (the third line, second screen). The display shows the start ramp setting of the last dosing session. When set to 0 the pump starts abruptly at full speed. When set to 5 the pump accelerates softly to full speed.
- If the setting displayed is correct, do nothing. **UP** and **DOWN** highlight the next or previous parameter.
- If you wish to change the setting, use the numeric keys to enter the desired setting: 0, 1, 2, 3, 4 or 5. An example is shown here. To quickly return to the starting value, press **SHIFT, 5 (CLEAR)**. If a number greater than 5 is entered, 5 is displayed and entered. Press **ENTER** to confirm. If you wish to change other parameters, use the **UP** and **DOWN** keys to highlight each as required. **DOWN** is assumed here.
End ramp

- Use the UP and DOWN keys to highlight the End ramp line of the display (the first line, third screen). The display shows the end ramp setting of the last dosing session. When set to ‘0’ the pump stops abruptly. When set to ‘5’ the pump decelerates softly to a stop.
- If the setting displayed is correct, do nothing. UP and DOWN highlight the next or previous parameter.
- If you wish to change the setting, use the numeric keys to enter the desired setting: 0, 1, 2, 3, 4 or 5. An example is shown here. To quickly return to the starting value, press SHIFT, 5 (CLEAR). If a number greater than 5 is entered, 5 is displayed and entered. Press ENTER to confirm. If you wish to change other parameters, use the UP and DOWN keys to highlight each as required. DOWN is assumed here.

Drip

The pump can be set to reverse briefly at the end of each dose to prevent drips.
- Use the UP and DOWN keys to highlight the Drip line of the display (the second line, third screen). The display shows the drip setting of the last dosing session: from 0 to 1.0 (zero to one revolution) at one-tenth of a revolution intervals.
- If the setting displayed is correct, do nothing. UP and DOWN highlight the next or previous parameter.
- If you wish to change the setting, use the numeric keys to enter the desired setting: zero revolutions to 1 revolution at 0.1 revolution intervals. An example is shown here. To quickly return to the starting value, press SHIFT, 5 (CLEAR). If a number greater than 1.0 is entered, 1.0 is displayed and entered. Press ENTER to confirm. If you wish to change other parameters, use the UP and DOWN keys to highlight each as required. DOWN is assumed here.

Note: The time taken by drip reversal is added to any dose interval time which may have been set.
Save and Proceed

The pump can operate immediately according to the parameters just entered; or you can save those settings by name as a dispense program for use now or later.

* Note: It is not necessary to cycle through all the dispense program settings before saving the new program or starting to dispense. You can jump straight to Save or Proceed at any point in the dispense program setting sequence; or you can press START at any point in the dispense program setting sequence.

- Use the UP and DOWN keys to highlight Proceed or Save (the third line, third screen).
- If you want the pump to operate without saving the parameters you have just set, press START or highlight Proceed and press ENTER to confirm. The pump briefly displays its pumphead, tube bore and flowrate settings. Even if you do not save the settings (and as long as you use no other saved settings), these values will be available the next time you use Dose mode.
- If you want to save the parameters you have just set, highlight Save. Press ENTER to confirm. The pump invites you to enter a name of up to eight characters for the new dispense program. An example name and settings are shown here.
- The name may include the letters A-Z, 'space' and the figures 0-9, entered one character at a time. Use the UP and DOWN keys to scroll the available characters. When the name entry screen first appears, a cursor highlights the space for the first character. Pressing UP causes the letter A to appear; pressing UP again within one second causes the letter B to appear... Pressing DOWN causes the figure 9 to appear; pressing DOWN again within one second causes the figure 8 to appear...
- After a delay of 1 second, the current character is accepted and the cursor moves on to the second space. Repeat to select the second character. If a 'space' is required at any point in the name, use the UP and DOWN keys to scroll to it; 'space' is located between 9 and A.
- At any time in entering the program name you may press STOP to delete the last character entered and replace it with another character. If STOP is pressed
Repeatedly, any number of characters or the entire name may be removed.

- When the program name is complete - any number of characters up to eight - press ENTER to save the program with that name.
- If the name is accepted, the pump briefly displays a confirmation screen with the message **Program saved**.
- If the name duplicates the name of a dispense program previously saved, the pump asks if the user wishes to overwrite the existing program with the new program. Use the UP and DOWN keys to highlight Yes or No and press ENTER to confirm. If No was selected, the pump invites the user to enter a new name; if Yes was selected, the pump briefly displays a confirmation screen with the message **Program saved**.
- The pump redisplayed the third screen of the dispense program setting sequence. If the user is wishes to run the new program, he may select Proceed as above or press START. The pump briefly displays its pumphead, tube bore and flowrate settings.
17.2 Loading a stored dispense program

If the user selected **Load program** from the Dose options displayed after selecting **Dose** on the Main menu screen, the Find program screen is displayed.

Use the **UP** and **DOWN** keys to highlight the first character of the dosing program you wish to load. Pressing **UP** causes the letter A to appear; pressing **UP** again within one second causes the letter B to appear... Pressing **DOWN** causes the figure 9 to appear; pressing **DOWN** again within one second causes the figure 8 to appear...

After a delay of 1 second, the pump displays the full name of its first stored program beginning with the displayed character.

Use the **UP** and **DOWN** keys to display the full names of all stored programs. Examples are shown here.

When the required program name is displayed, press **ENTER** to confirm.

The pump offers three choices: **Proceed**, **Review program** and **Delete program**. Use the **UP** and **DOWN** keys to highlight an option and press **ENTER** to confirm.

If **Proceed** was chosen, the pump runs the selected program. See 17.3 Starting a dispense program.

If **Review program** was chosen, the pump displays the first screen of the Dispense program parameters menu. See 17.1 Setting a dispense program.

If **Delete program** was chosen, the pump asks for confirmation. Use the **UP** and **DOWN** keys to highlight **Yes** to delete the program; highlight **No** to retain the program and return to the previous screen.

**Note**: If the security code is set, the user must correctly enter the security code before the pump will delete the program. See 19.22 Security code entry.
17.3 Starting a dispense program

After a dispense program has been set or loaded, it may be started.

- If **SHIFT, 8 (CAL)** is pressed, the pump allows the user to run the calibration sequence. See 18 Calibrate.
- When calibration is complete or if it was not selected, the pump summarises the program it is ready to run and invites the user to press **START** or apply a remote signal (see 20.5 Dose input) to start it.

When a dispense program has been set or loaded, it may be started. An invitation to recalibrate the pump is displayed for 3 seconds, before a summary of the program appears.

- If **SHIFT, 8 (CAL)** is pressed, the pump allows the user to run the calibration sequence. See 18 Calibrate.
- When calibration is complete or if it was not selected, the pump checks whether a computer is connected to the pump. If so, the pump allows the user to enter information about the pump operator and the dispense batch. See User and batch sequence.
- When user and batch information has been entered, or if no computer is connected to the pump, the pump summarises the program it is ready to run and...
invites the user to press **START** or apply a remote signal (see 20.5 Dose input) to start it.

**17.4 User and batch sequence**

If a computer is connected to the pump, the pump records two pieces of information about the current batch.

- The pump asks for the name of the operator. Up to 16 characters may be entered.
- Use the **UP** and **DOWN** keys to highlight the first character of the operator's name. Pressing **UP** causes the letter A to appear; pressing **UP** again within one second causes the letter B to appear... Pressing **DOWN** causes the figure 9 to appear; pressing **DOWN** again within one second causes the figure 8 to appear...
- After a delay of 1 second, the current character is accepted and the cursor moves on to the second space. Repeat to select the second character. If a 'space' is required at any point in the name, use the **UP** and **DOWN** keys to scroll to it: 'space' is located between 9 and A.
- When the name is complete, press **ENTER** to confirm. The operator's name is saved. The information entered will be output when the batch is run.

- The pump asks for the name of the batch. Up to 16 characters may be entered.
- Use the **UP** and **DOWN** keys to highlight the first character of the batch name. Pressing **UP** causes the letter A to appear; pressing **UP** again within one second causes the letter B to appear... Pressing **DOWN** causes the figure 9 to appear; pressing **DOWN** again within one second causes the figure 8 to appear...
- After a delay of 1 second, the current character is accepted and the cursor moves on to the second space. Repeat to select the second character. If a 'space' is required at any point in the name, use the **UP** and **DOWN** keys to scroll to it: 'space' is located between 9 and A.
- When the name is complete, press **ENTER** to confirm. The batch name is saved. The information entered will be output when the batch is run.
- The pump summarises the program it is ready to run and invites the user to press **START** to run it.
17.5 While a dispense program is running

A dispense program may call for the pump to dispense:

- a batch containing a known number of single doses, each dosed on demand by a trigger such as a press on **START** or a footswitch, or a plc signal (note that at the end of such a batch the options available are to return to the main menu or to repeat the batch by pressing **START**);
- a batch of a known number of doses with a pre-set time interval between doses, started by a trigger as above;
- an unknown number of doses to be dosed singly on demand by a trigger as above.

The first two options are governed by the Dose interval setting in the dispense program. See 17.1 Setting a dispense program. If the interval is set to zero, the pump dispenses doses singly. If the interval is set to any other figure, the batch will be dispensed.

The third option is governed by the Number of doses setting in the dispense program. See 17.1 Setting a dispense program.

- Press **START**.
- The pump starts dispensing the first dose of the batch, and displays its progress: dose size; how many doses in the batch are still to be dispensed; how many doses in the batch have been dispensed.
- If a computer is connected to the pump (620Di only), all the current program parameters are output, plus the current date and time. An example is shown here:

```
Pump address 16
Pump type 620Di
Pumphead 620L
Tube 6.4 mm
Program name PROG1
Flow calibration 6.780 ml/rev
Dose size 123.4 ml
Interval 10 s
Number of doses 9999
Speed 100.5 rpm
Direction CCW
Start ramp 0
End ramp 1
Drip 1
Operator ID Joe Lee
Batch ID ABC 25 10 2005
Date 25.10.05
Time 16:42:00
Program started
```
A batch of single doses

- If the batch was set to be dispensed with an interval between doses of zero seconds, the pump stops after dispensing the first dose of the batch and waits for a further press on **START**.
- When **START** is pressed it starts dispensing the next dose of the batch, and displays its progress: dose size; how many doses in the batch have been dispensed; how many doses in the batch are still to be dispensed.
- This cycle is repeated until the batch is complete. The pump summarises the batch just completed.
- Use the **UP** and **DOWN** keys to select **Menu** to return to the Main menu and press **ENTER** to confirm.
- Use the **UP** and **DOWN** keys to select Start to run the batch again, and press **ENTER** to confirm.

**Alternatively...**
Press **START** to run the batch again.

- If a computer is connected to the pump (620Di only), a log message is output. An example is shown here:

```
Pump address 16
Program name PROG1
Doses completed 9999
Date 25.10.05
Time 16:42:00
Batch completed
```

The batch can be paused or stopped at any time.

- Press **STOP** or apply a remote pause-dose signal, while the batch is being dispensed to pause or stop the batch. See 17.6 To stop or pause a dispense program.
A batch of timed doses

- If the batch was set to be dispensed with an interval between doses greater than zero seconds, the pump stops after dispensing the first dose of the batch and waits for the interval to pass.
- When the interval has passed it starts dispensing the next dose of the batch, and displays its progress: dose size; how many doses in the batch have been dispensed; how many doses in the batch are still to be dispensed.
- This cycle is repeated until the batch is complete. The pump summaries the batch just completed. Use the UP and DOWN keys to select Menu to return to the Main menu and press ENTER to confirm. Use the UP and DOWN keys to select Start to run the batch again, and press ENTER to confirm. Alternatively...
  Press START to run the batch again.
- If a computer is connected to the pump (620Di only), a log message is output. An example is shown here:

```
Pump address 16
Program name PROG1
Doses completed 9999
Date 25.10.05
Time 16:42:00
Batch completed
```

The batch can be paused or stopped at any time.

- Press STOP or apply a remote pause-dose signal, while the batch is being dispensed to pause or stop the batch. See 17.6 To stop or pause a dispense program.

An unknown number of single doses

- If the batch was set to contain 1 dose, the pump starts dispensing the dose, and displays its progress: dose size; and how many doses have been dispensed. It stops after dispensing that dose and waits for a further press on START.
- Press START to run the batch again.

The cycle can be paused or stopped at any time.
- To pause a dose, press STOP or apply a remote pause-dose signal while a dose
is being dispensed. See 17.6 To stop or pause a dispense program.

- To stop the cycle, press **STOP**, or apply a remote pause-dose signal, after a dose has been dispensed. See 17.6 To stop or pause a dispense program.

### 17.6 To stop or pause a dispense program

A batch can be stopped or paused by pressing **STOP**, or applying a remote pause-dose signal, while the batch is being dispensed. See 19.11 Remote stop.

- If the batch was paused by applying a remote pause-dose signal, the pump stops and displays its progress; when the remote pause-dose signal is no longer applied, the pump continues from where it left off, completing any interrupted dose.

- If the batch was paused by pressing **STOP**, the pump stops and offers four choices: **Unpause**, **Restart**, **Recalibrate** and **Exit**.

- In either case (pause or stop), if a computer is connected to the pump (620Di only), a status message is output. An example is shown here:

```
Pump address 16
Program name PROG1
Doses completed 520
Doses to go 9479
Date 25.10.05
Time 16:52:00
Batch paused
```
* Note: If dispensing is resumed after a remote pause-dose signal or by selecting Unpause, any interrupted dose is continued. If dispensing is resumed by selecting Restart, any interrupted dose is aborted and repeated from its start.

- Use the UP and DOWN keys to make a selection and press ENTER to confirm.
- If Unpause is selected, dispensing is resumed where it left off. Any interrupted dose is completed.
- If Restart is selected, the pump offers to restart any interrupted dose or to restart the interrupted batch. Use the UP and DOWN keys to highlight Restart dose or Restart batch and press ENTER to confirm.
  - If Restart dose is selected, dispensing is resumed where it left off. Any interrupted dose is aborted and repeated from its start.
  - If Restart batch is selected, the interrupted batch is aborted and the pump waits for START to be pressed to begin the batch again.
- If a computer is connected to the pump (620Di only), a status message is output. An example is shown here:

```
Pump address 16
Program name PROG1
Doses completed 521
Date 25.10.05
Time 16:59:00
Batch aborted
```
Use the UP and DOWN keys to make a selection and press ENTER to confirm.

If Exit is selected, the pump offers to restart the interrupted batch or to display the Main menu. In either case the previous batch is aborted. Use the UP and DOWN keys to highlight Menu or Restart batch and press ENTER to confirm.

If a computer or printer is connected to the pump (620Di only), a status message is output. An example is shown here:

Pump address 16
Program name PROG1
Doses completed 521
Date 25.10.05
Time 16:59:00
Batch aborted

If Menu is selected, the pump displays the Main menu.

If Restart batch is selected, the pump waits for START to be pressed to begin the batch again.

If Recalibrate is selected, the pump may be recalibrated. See 18 Calibrate.

Note: Recalibration can also be invoked during dosing. Press SHIFT, 8 (CAL) while a dose is being dispensed. The dose will continue to run while the recalibration is performed. The current dose will not be affected; the new calibration will take effect from the next dose. If SHIFT, 8 (CAL) is pressed when dosing is stopped, full calibration (as against recalibration) may be performed. See 18 Calibrate.
18 Calibrate

Calibrate and Recalibrate are different processes. Calibrate allows the user to set up the pump before use to correctly display flowrate in the units per revolution chosen during the Setup sequence. (See 19 Setup.) Recalibrate allows the user to adjust the pump's flowrate while it is in use; it can even be initiated while a dispense batch is running (by pressing SHIFT, 8 (CAL)).

Pumphead and tube sizes available

<table>
<thead>
<tr>
<th>Pumphead</th>
<th>Tube sizes (mm)</th>
<th>Note: 620R, 620RE and 620RE4 pumpheads are driven by a dedicated 620 drive; 620L and 620LG pumpheads are driven by a dedicated 620 drive. Pumpheads are not interchangeable between drive types. 625L pumpheads are not suitable for use with either type of 620 drive.</th>

Calibrate

To dispense the correct amount of fluid the pump must know which pumphead is fitted and the tube size in the pumphead. The pump is pre-programmed with default flowrate figures for a range of pumpheads and tubes. For the most accurate calibration, you may measure the flow from the pump and enter this value instead of the default.

Use the UP and DOWN keys to highlight Calibrate in the main menu. Press ENTER to confirm.

The pump displays its current settings: pumphead, tube size and flowrate; the default for each standard pumphead is the largest tube the pumphead can take. Example information is shown here.

Use the UP and DOWN keys to highlight Accept or Change. Press ENTER to confirm.

If Accept is selected, the default or previously set flowrate data for that pumphead and tube size are used in flowrate calculations. The pump displays the main running screen.

If Change is selected with a security code in place, the pump starts its security code entry sequence. See 19.22 Security code entry. When the correct code is
entered, the pump offers three options: **Head and tube; Tube; and Calibration dose.** If **Change** is selected with no security code in place, the three options are displayed immediately.

- Use the **UP** and **DOWN** keys to make a selection. Press **ENTER** to confirm.

**Head and tube**

- If **Head and tube** is selected, the pump displays a list of standard pumpheads that can be fitted to the pump.
- Use the **UP** and **DOWN** keys to make a selection. Press **ENTER** to confirm.
- The pump displays tube sizes, as below.

**Tube**

- If **Tube** is selected or a pumphead choice has just been made, the pump displays a list of standard tube sizes that can be used in the pumphead previously identified. An example is shown here.
- Use the **UP** and **DOWN** keys to make a selection. Press **ENTER** to confirm.
- The pump offers to run a calibration dose, as below.
If **Calibration dose** is selected or if a tube choice has just been made, the pump offers to run a calibration dose. Use the UP and DOWN keys to choose Yes or No. Press ENTER to confirm. Examples are shown here.

If No is selected after a tube selection has been made (see Tube above), the pump briefly displays a confirmation screen showing current head, tube and flow settings, and displays the main running screen.

If **Calibration dose** is selected or if Yes is selected after a tube selection has been made (see Tube above), the pump displays the speed and direction at which it was last running in manual mode or to which it has just been set and invites the user to press START.

**Note**: it is possible at this point to change the direction of rotation using the DIRECTION (SHIFT, 1) key, and to change the speed of rotation using the numeric keys (followed by ENTER), or the UP and DOWN keys, within the minimum and maximum limits that have been set. See 19.13 Set maximum allowed speed and 19.14 Set minimum allowed speed. If the pumphead has been changed at this point, any previously set speed will be over-ridden by any lower pumphead maximum speed. The user can re-prime the pump before calibration by pressing SHIFT, 4 (MAX) (if Always enabled was selected while setting up the pump - see 19 Setup).

Put a measuring container at the pump outlet. Press START. The pump runs for 4 minutes, displaying an information screen for 15 seconds and a further information screen for the rest of the 4 minutes. You may stop the calibration dose at any time with the STOP key - but allow the pump to run as long as possible to obtain the most accurate calibration. A minimum of 15 seconds is recommended.
Measure the quantity of fluid dispensed. The pump displays its calculated dose, based on previous calibration data. Use the numeric keys to adjust this reading to match the measured volume. Press ENTER. The pump briefly displays the new head, tube and flow settings, and displays the main running screen. Example figures are shown here.

Note: If the pump has been set to display flow rate in units of mass (see 18.8 Flow units), as in this example, the pump displays a screen allowing you to confirm the specific gravity of the duty fluid immediately before the final press on ENTER.

Note: Always calibrate after changing pump tubes, fluid, or any connecting pipework. It is also recommended that the pump is recalibrated periodically to maintain accuracy.

Recalibrate

- After pressing STOP while the pump is running, use the UP and DOWN keys to highlight Recalibrate and press ENTER to confirm.

Alternatively...
- Press SHIFT, 8 (CAL) while in a dispensing sequence to carry out the recalibration "on the fly".

Note: If SHIFT, 8 (CAL) is pressed when a dispensing sequence is not in progress or is paused, full calibration will be carried out.

- The pump displays the current dose size. Enter a new value using the numeric keys and press ENTER to confirm.

- If the dose size required is within 25% of the previous dose size, the pump accepts the new dose size and offers four choices: Unpause, Restart, Recalibrate and Exit. Use the UP and DOWN keys to make a selection and press ENTER to confirm. If the recalibrate sequence was entered by pressing SHIFT, 8 (CAL) while a dose was being dispensed, the pump redisplays the running screen and continues to dispense without waiting for a further command. The new calibration takes effect when the next full dose is started.

- If a computer is connected to the pump (620Di only), a status message is output. An example is shown here:

```
Pump address 16
Program name PROG1
Doses completed 521
Date 25.10.05
Time 16:59:00
Flow calibration 6.830 ml/rev
Recalibrated
```

- If the dose size required is more than 25% larger or smaller than the previous dose size, the pump briefly displays a warning message and invites the user to enter a new value.

Note: After highlighting Recalibrate and pressing ENTER to confirm, or pressing SHIFT, 8 (CAL) while a dose is being dispensed, the user can reprime the pump before recalibration by pressing SHIFT, 4 (MAX) (if Always enabled was selected while setting up the pump - see Setup).
19 Setup

Entry to the Setup menu is from the Main menu and can be limited to users who correctly enter a three-digit security code. If a security code has been set, selecting Setup and confirming with the ENTER key causes the pump to display the Security code entry sequence. See 19.22 Security code. If no security code has been set, the pump displays the first of seven screens containing the Setup menu.

The Setup menu

The Setup menu occupies five screens. The first two are shown here.

To move from one screen to subsequent screens, repeatedly press DOWN. Each item is highlighted in turn until the last item on the screen is highlighted.

A further press on the DOWN key displays the next screen of the menu, with the first item highlighted.

Follow the reverse procedure using the UP key to move to an item on a previous screen of the menu.

Make a selection using the UP or DOWN keys and press ENTER to confirm your choice.
19.1 Dosing

Items in Dosing sub-menus allow the user to set features of dosing performance.

Dosing flow units

The user can choose revolutions per minute or flowrate as flow units for dosing (as distinct from flow units for manual pumping).

- In the first screen of the Setup menu select Dosing. Use the UP and DOWN keys. Press ENTER to confirm. The pump offers revolutions per minute or flowrate as dosing flow units.
- Use the UP and DOWN keys to select RPM or Flowrate. Press ENTER to confirm. The pump records the user’s preference and displays the Lock Start ramp screen.
  
  Note: The choice of flowrate units may be made later. See 19.7 Flow units.

Lock start ramp

The user can choose between pre-setting and locking the Start ramp setting so that it cannot be altered by dispense programs during operation - Yes - or leaving it free to be altered by dispense programs during operation - No.

- Use the UP and DOWN keys to select Yes or No from the Lock start ramp screen. Press ENTER to confirm.
- If No is selected, the Start ramp setting is left to dispense programs. The pump displays the Lock end ramp screen.
- If Yes is selected, the pump displays the Start ramp pre-setting screen, showing the pre-setting of the last dosing session. When set to 0 the pump starts abruptly at full speed. When set to 5 the pump accelerates softly to full speed.
- If the setting displayed is correct, press ENTER. The pump displays the Lock end ramp screen.
- If you wish to change the setting, use the numeric keys to enter the desired setting: 0, 1, 2, 3, 4 or 5. To quickly return to the starting value, press SHIFT, 5 (CLEAR). If a number greater than 5 is entered, 5 is displayed and entered. Press ENTER to confirm. The pump displays the Lock end ramp screen.
Lock end ramp

The user can choose between pre-setting and locking the End ramp setting so that it cannot be altered by dispense programs during operation - Yes - or leaving it free to be altered by dispense programs during operation - No.

- Use the UP and DOWN keys to select Yes or No from the Lock end ramp screen. Press ENTER to confirm.
- If No is selected, the End ramp setting is left to dispense programs. The pump displays the Lock drip screen.
- If Yes is selected, the pump displays the End ramp pre-setting screen, showing the pre-setting of the last dosing session. When set to 0 the pump stops abruptly. When set to 5 the pump decelerates softly to a stop.
- If the setting displayed is correct, press ENTER. The pump displays the Lock drip screen.
- If you wish to change the setting, use the numeric keys to enter the desired setting: 0, 1, 2, 3, 4 or 5. To quickly return to the starting value, press SHIFT, 5 (CLEAR). If a number greater than 5 is entered, 5 is displayed and entered. Press ENTER to confirm. The pump displays the Lock drip screen.

Lock drip

The user can choose between pre-setting and locking the Drip setting so that it cannot be altered by dispense programs during operation - Yes - or leaving it free to be altered by dispense programs during operation - No.

- Use the UP and DOWN keys to select Yes or No from the Lock drip screen. Press ENTER to confirm.
- If No is selected, the drip setting is left to dispense programs. The pump redisplay the first screen of the Setup menu.
- If Yes is selected, the pump displays the Drip pre-setting screen, showing the pre-setting of the last dosing session: from 0 to 1.0 (zero to one revolution) at one-tenth of a revolution intervals.
- If the setting displayed is correct, press ENTER. The pump confirms the Start ramp, End ramp and Drip settings for four seconds and redisplay the first screen of the Setup menu.
If you wish to change the setting, use the numeric keys to enter the desired setting: zero revolutions to 1 revolution at 0.1 revolution intervals. To quickly return to the starting value, press \textit{SHIFT, 5 (CLEAR)}. If a number greater than 1.0 is entered, 1.0 is displayed and entered. Press \textit{ENTER} to confirm. The pump confirms the Start ramp, End ramp and Drip settings for four seconds and redisplays the first screen of the Setup menu.

19.2 Display

The pump can display two default screens in manual mode: revolutions per minute, or flowrate in a choice of units.

- In the first screen of the Setup menu select \textit{Display} using the \textbf{UP} and \textbf{DOWN} keys. Press \textit{ENTER} to confirm your choice.
- The pump displays a screen allowing you to choose the format of the manual mode main screen. Use the \textbf{UP} and \textbf{DOWN} keys to choose and press \textit{ENTER} to confirm your decision.
- If you choose \textit{Flowrate} and you have not calibrated the pump since switching it on, a warning screen is displayed for 4 seconds. The warning does not appear if the display screen formats are cycled again, unless the pump has been switched off in the mean time.
- The pump redisplays the first screen of the Setup menu.
- When the pump next runs, the manual mode main screen will display pump activity in rpm, or flowrate (in the units you chose - see 19.7 Flow units), according to your choice. Examples are shown here.

\textbf{Alternatively} ...

- In the manual mode main screen, repeatedly press \textit{ENTER} to cycle the display between rpm or flowrate (in the units you chose - see 19.7 Flow units) according to your choice. This cycle operates if the pump is running and if it is stopped. While the pump is running, you can cycle the display in the same way by repeatedly pressing \textbf{START}. In both cases, if you have not calibrated the pump since switching it on, a warning screen is displayed for 4 seconds before the flowrate screen appears. The warning does not appear if the display screen formats are cycled again, unless the pump has been switched off.
- The pump redisplays the first screen of the Setup menu.
19.3 Pump I/D

The 620Di pump can be individually controlled under RS232 as one of up to 16 pumps. The 620DiN pump can be individually controlled under RS485 as one of up to 32 pumps. First the pump must be given its identity number.

- In the first screen of the Setup menu select **Pump I/D** using the **UP** and **DOWN** keys. Press **ENTER** to confirm your choice.
- The pump displays a screen allowing you to change the pump’s identity number. Use the numeric keys to enter a new number in the display and press **ENTER** to confirm your decision. An example is shown here.
- The pump displays the first screen of the Setup menu.

19.4 Baud

The pump can be set to communicate with control devices at a choice of baud rates.

- In the first screen of the Setup menu select **Baud** using the **UP** and **DOWN** keys. Press **ENTER** to confirm your choice.
- The pump displays a screen allowing you to change the pump’s baud rate. Use the **UP** and **DOWN** keys to select **1200**, **2400**, **4800** or **9600** (or, 620DuN only, **19k2**) and press **ENTER** to confirm your decision.
- The pump displays the first screen of the Setup menu.
19.5 Stop bits

The pump can be set to communicate with control devices at a choice of stop bits settings.

- In the first screen of the Setup menu select **Stop bits** using the **UP** and **DOWN** keys. Press **ENTER** to confirm your choice.
- The pump displays a screen allowing you to change the pump's stop bits setting. Use the **UP** and **DOWN** keys to select 2, 1, or 0 and press **ENTER** to confirm your decision.
- The pump displays the first screen of the Setup menu.

19.6 Xon/Xoff

The pump can be set to communicate with control devices using Xon/Xoff flow control.

- In the second screen of the Setup menu select **Xon/Xoff** using the **UP** and **DOWN** keys. Press **ENTER** to confirm your choice.
- The pump displays a screen allowing you to set flow control on or off. Use the **UP** and **DOWN** keys to choose and press **ENTER** to confirm your decision.
- The pump displays the second screen of the Setup menu.
**19.7 Flow units**

The pump can display its flow rate in metric (SI) or US (imperial) units of volume or mass.

* Note: "ul" shown here and used on pump displays represents "µl" (microlitres).

- In the second screen of the Setup menu select **Units** using the **UP** and **DOWN** keys. Press **ENTER** to confirm.
- The pump displays a screen offering Metric or US. Use the **UP** and **DOWN** keys to choose **Metric** or **US**. Press **ENTER** to confirm.
- If you chose Metric, the pump offers a choice of units. Use the **UP** and **DOWN** keys to choose **µl, ml, l, g or kg** and press **ENTER** to confirm.
- If you chose US, the pump offers a choice of units. Use the **UP** and **DOWN** keys to choose **floz, pt, gal, oz or lb** and press **ENTER** to confirm.
- If you chose a volumetric flow rate from either screen, a confirmation screen appears briefly and the pump redisplays the second screen of the Setup menu.
- If you chose a mass flowrate from either screen, the pump asks for the specific gravity of the fluid to be pumped. Use the numeric keys to enter a value between 0.01 and 15. If a number greater than 15 is entered, 15 is displayed and entered. Press **ENTER** to confirm your decision. Press **STOP** if you decide to make a different choice of units.
- A confirmation screen appears briefly and the pump redisplays the second screen of the Setup menu.
19.8 Date and time

To record dosing sessions the pump's real-time clock needs to know the date and time.

In the second screen of the Setup menu select **Date/time** using the UP and DOWN keys. Press ENTER to confirm. The pump displays any previous setting.

If the setting displayed is correct, press ENTER. The pump redisplays the second screen of the Setup menu.

If you wish to change the setting, use the UP and DOWN keys to enter the current date (two digits), month (three letters), year (four digits), hour, minute and second (all two digits), pressing ENTER to confirm each one.

When ENTER is pressed to confirm the seconds, the pump redisplays the second screen of the Setup menu.

19.9 Max key operation

The pump must be primed - its tube filled with duty fluid - if it is to dispense immediately. This is done by pressing and holding **SHIFT, 4 (MAX)** to operate the pump at full speed until duty fluid reaches the discharge port. Priming ceases when **SHIFT, 4 (MAX)** is released. **SHIFT, 4 (MAX)** can be set to function in a narrow or a wide range of circumstances.

In the second screen of the Setup menu select **Max** using the UP and DOWN keys. Press ENTER to confirm.

Use the UP and DOWN keys to select **Standard setting** if you want **SHIFT, 4 (MAX)** to invoke priming only when the pump is in Manual mode or Dose mode while waiting for a press on START to begin dosing. Select **Always enabled** if you want **SHIFT, 4 (MAX)** to invoke priming when the pump is in Manual mode, Calibrate or Dose mode while stopped. Press ENTER to confirm. The pump redisplays the second screen of the Setup menu.

**Note:** **SHIFT, 4 (MAX)** has no effect in Network or Setup mode.
19.10 Outputs

The 620DiN pump offers four relay status outputs. See 12 Switching the pump on for the first time for initial start-up defaults. Each of seven parameters can be configured to any output, or more than one output.

The 620Di pump offers four digital status outputs. See 12 Switching the pump on for the first time for initial start-up defaults. Each of seven parameters can be configured to any output, or more than one output.

The parameters are:

Run/stop
Provides a status output to indicate whether the pumphead is running or stopped at all times. When running at 0rpm, the run/stop output indicates running.

General alarm
Provides an alarm output when any system error condition occurs except: leak detected; analogue signal out of range; analogue over-signal; analogue no signal.

Direction
Provides a status output to indicate which direction the pump is set to run in.

Leak detected
When used with a leak detector, this output provides an alarm when the pump has been automatically switched off following tube failure.

Net / man
Provides a status output to indicate whether the pump is under network control or manual control.

Dose
Provides a status output to indicate whether the pumphead is running or stopped while dosing is taking place.

Batch
Provides a status output to indicate whether a dispense batch is in progress.

Output 1 and output 2 are available in two formats:
- From pins 10 and 11, lower D-connector, as 5V TTL signals.
- From pins 10 and 11, upper D-connector, as open collector logic outputs.

Output 3 and output 4 provide open collector logic outputs from pins 13 and 12, upper D-connector, respectively.

A supply voltage from the pump (5V, 10V, 12V) or user-supplied up to 30V to pin 22, upper D-connector, provides the voltage level for these logic status outputs.

Outputs 1-4 are available as single-pole change-over relay contacts: Relay 1, 2, 3 and 4. Connect to the normally open or normally closed contacts of the relay as required and configure the pump’s software accordingly. See below in this section.

Note: The maximum rating on the relay contacts of this pump is 30VDC; maximum load 30W.
In the second screen of the Setup menu select **Outputs** using the **UP** and **DOWN** keys. Press **ENTER** to confirm.

The pump displays the Output selection screen, from which you can configure each of the four outputs, or exit this menu. Use the **UP** and **DOWN** keys to choose and press **ENTER** to confirm.
If Output 1 is chosen, the pump displays the Outputs menu.

The Outputs menu occupies two screens.

To move from one screen to subsequent screens, repeatedly press DOWN. Each item is highlighted in turn until the last item on the screen is highlighted.

A further press on the DOWN key displays the next screen of the menu, with the first item highlighted.

Follow the reverse procedure using the UP key to move to an item on the first screen of the menu.

- Selecting General or Leak using the UP and DOWN keys and confirming the choice by pressing ENTER configures that option to Output 1, displays a confirmation screen, and returns the user to the Output selection screen.
- Selecting Run/Stop, Direction, Net/Man, Dose or Batch using the UP and DOWN keys and confirming the choice by pressing ENTER displays screens allowing the user to configure Run to High or Low, Clockwise to High or Low, Net to High or Low, Dose to High or Low and Batch to High or Low respectively. Choose using the UP and DOWN keys and press ENTER to confirm. The option chosen is configured to Output 1. The pump displays a confirmation screen, and returns the user to the Output selection screen. An example is shown here.
- The user can configure Output 2, Output 3 and Output 4 in the same way, or choose Exit.
- If STOP is pressed during configuration, the previous setting for the output is retained and the pump redisplay the Output selection screen.
- If Exit is chosen, the pump returns the user to the second screen of the Setup menu.

### Outputs 1-4: First-time start-up defaults

### 19.11 Remote stop

The 620DiN pump can be started and stopped with a remote switch between the 5V terminal and the i/p terminal of the Run/stop input, using an open=run or open=stop command sense. It also operates with a logic input between 5V and 24V on the i/p terminal of the Run/stop input. If remote switching is disabled, neither the remote run/stop nor direction signal inputs will affect the pump state.

The 620Di pump can be started and stopped with a remote switch between pin 7 and pin 19 using an open=run or open=stop command sense. It also operates with
a logic input between 5V and 24V on pin 7. If remote switching is disabled, neither the remote run/stop nor direction signal inputs will affect the pump state.

- In the third screen of the Setup menu select **Remote stop** using the **UP** and **DOWN** keys. Press **ENTER** to confirm.
- The pump displays a screen allowing the user to disable the remote stop feature. Use the **UP** and **DOWN** keys to choose **Yes** or **No** and press **ENTER** to confirm.
- If **No** is chosen, the pump asks the user to make a further choice: whether the pump is required to run on an open or closed remote switch: **Open=stop** or **Open=run**. Choose using the **UP** and **DOWN** keys and press **ENTER** to confirm. The pump briefly displays a confirmation screen and returns the user to the third screen of the Setup menu.
- If **Yes** is chosen, the pump briefly displays a confirmation screen and returns the user to the third screen of the Setup menu. **Note:** The confirmation screen indicates whether Remote stop is enabled or disabled, and displays the command sense of the remote control switch even if Remote stop has been disabled.

**Alternatively ...**

- To toggle the sense of the remote run / stop control between open=stop and open=run: stop the pump. Turn off the mains power switch at the rear of the pump.
- Hold down the **STOP** key and the **1 (DIRECTION)** key, and turn on the mains power switch. The **UP** and **DOWN** keys can then be used to toggle the sense of remote run / stop control between open=stop and open=run.

See 20.3 Run / stop input.
19.12 Auto-restart

This pump offers an auto-restart feature. If active on power loss, it restores the pump when power returns to the operating state it was in when power was lost. It does not operate when powering down in the middle of a dose: when the pump is restarted, it will await a press on the START key to begin the interrupted dose again. Auto-restart is retained while the pump is switched off. When the pump starts running, look for the ! symbol on the display. This symbol indicates that the pump is set for auto-restart.

- In the third screen of the Setup menu select Auto-restart using the UP and DOWN keys. Press ENTER to confirm.
- The pump displays a screen allowing the user to activate auto-restart. Use the UP and DOWN keys to choose On or Off and press ENTER to confirm.
- If Off is chosen, the pump returns the user to the third screen of the Setup menu. The auto-restart facility will not operate.
- If On is chosen, the pump returns the user to the third screen of the Setup menu, where an exclamation mark ( ! ) is now visible. This mark confirms that the auto-restart feature is in place and will operate the next time power is lost and restored.

Alternatively ...

- Stop the pump. Turn off the mains power switch at the rear of the pump.
- Hold down the START key and turn on the mains power switch. The ! symbol shows on the display.
- Start the pump. If the mains supply is interrupted the pump will automatically restart when the mains power returns.
- To remove auto-restart switch off the mains power at the rear of the pump. Hold down the STOP key and turn the mains power switch on. The ! symbol does not appear.

Do not use auto-restart for more than 100 starts per hour. We recommend remote control where a high number of starts is required.
19.13 Set maximum allowed speed

The maximum allowed speed of the drive defaults to 165rpm. It is possible to set this limit at any speed down to 1rpm as long as the minimum allowed speed is at least 1rpm less, or up to 265rpm; however, see 8.1 Pressure capability for use above 165rpm.

- In the third screen of the Setup menu select **Set max speed** using the **UP** and **DOWN** keys. Press **ENTER** to confirm.
- The pump displays a screen allowing the user to set the maximum speed of the pump equal to or lower than the maximum available. Use the numeric keys to set the maximum allowed speed and press **ENTER** to confirm.
- The pump returns the user to the third screen of the Setup menu, via a warning screen requiring the user to press **ENTER** if he selected a speed greater than 165rpm.

19.14 Set minimum allowed speed

The minimum allowed speed of the drive defaults to 0rpm. It is possible to set this limit at any speed up to 264rpm, as long as the maximum speed is at least 1rpm greater.

- In the fourth screen of the Setup menu select **Set min speed** using the **UP** and **DOWN** keys. Press **ENTER** to confirm.
- The pump displays a screen allowing the user to set the minimum speed of the pump equal to or higher than the minimum available. Use the numeric keys to set the minimum allowed speed and press **ENTER** to confirm the figure.
- The pump returns the user to the fourth screen of the Setup menu.
19.15 Scrolling

The pump’s speed can be set, up to the maximum allowed speed and down to the minimum allowed speed, by pressing the numeric keys or by using the UP and DOWN keys.

The numeric keys allow the user to select a speed in increments of one-tenth of a revolution per minute (or the equivalent in flow rate if the pump has been configured to display its performance in units of flow).

The UP and DOWN keys allow the speed to be set in increments of the user’s choice: one-tenth of a revolution per minute; one half of a revolution per minute; one, two, five or ten revolutions per minute (or their equivalents in flow rate if the pump has been configured to display its performance in units of flow). Each press on UP, for example, offers a speed one increment greater than the current speed.

Note: For 0.1rpm, 0.5rpm and 1rpm settings, the increments increase progressively as long as the UP and DOWN keys are pressed.

In the fourth screen of the Setup menu select Scrolling using the UP and DOWN keys. Press ENTER to confirm.

The pump displays a screen allowing the user to set the UP and DOWN keys’ scrolling increment. Use the UP and DOWN keys to choose 0.1, 0.5, 1.0, 2.0, 5.0 or 10.0. Press ENTER to confirm your choice.

The pump returns the user to the fourth screen of the Setup menu.

Note: If the maximum allowed speed has been set to a figure which is not a multiple of the chosen increment, the last active press on UP raises the speed to that maximum rather than to the next multiple of the chosen increment. Similarly, if the pump is running at a speed which is not a multiple of the chosen increment, the first press on UP raises the speed to the next multiple of the chosen increment.

19.16 Backlight

The pump’s display can be illuminated or not according to choice.

In the fourth screen of the Setup menu select Backlight using the UP and DOWN keys. Press ENTER to confirm.

The pump displays a screen allowing the user to switch the display backlight on or off. Use the UP and DOWN keys to choose On or Off and press ENTER to confirm.

The pump returns the user to the fourth screen of the Setup menu. The display is now illuminated or not according to the user’s decision.
Alternatively ...
- To turn the backlight off: press STOP and DOWN together while the pump is stopped.
- To turn the backlight on: press STOP and UP together while the pump is stopped.

19.17 ROM

The pump can display its software version, model number and pump speed.

In the fourth screen of the Setup menu select ROM using the UP and DOWN keys. Press ENTER to confirm.
- The pump displays the software version, model number (620Di for 620Di and 620DiN) and the maximum allowed pump speed for four seconds (an example is shown here), then returns the user to the fourth screen of the Setup menu. It also displays a checksum: CHK 123, for example. This may be required if reporting pump performance to the Flexicon service department.

Alternatively ...
Press 1 (DIRECTION) and DOWN together in Manual mode to interrupt the display and show the pump’s ROM version for four seconds.

19.18 Pin out details

Selecting Pin out details causes the pump to display an information screen and then its preset pin and voltage details under 13 headings: Direction enable, Direction input, Run/Stop input, Leak input, Dose input, Output 1, Output 2, Output 3, Output 4, Supply, 0 volts, Earth and Others. No user input is available in this section; it displays information only.

In the fifth screen of the Setup menu select Pin out details using the UP and DOWN keys. Press ENTER to confirm.
The Pin out details menu

The Pin out details menu occupies four screens. The first two are shown here.

To move from one screen to subsequent screens, repeatedly press DOWN. Each item is highlighted in turn until the last item on the screen is highlighted. A further press on the DOWN key displays the next screen of the menu, with the first item highlighted.

Follow the reverse procedure using the UP key to move to an item on a previous screen of the menu.

- Use the UP or DOWN keys to make a selection. Press ENTER to confirm.
- The information on pin outs duplicates the details described in this instruction manual under Automatic control wiring.
- The screens available are all presented in a similar manner. For example, on selecting Run/Stop input, the following screen is displayed:

```
Lower connector
18 0V  19/23 5V
max24V
```

This indicates that the analogue input signal must be applied to pin 4 of the lower D-connector at the rear of the pump, where 0 volts is available on pin 16. If the analogue input is configured for a 4-20mA signal, the maximum permitted voltage is 5 volts; if the analogue input is configured for a 0-10V or 1-5V signal, the maximum permitted voltage is 10 volts.

Pressing STOP or ENTER in any Pin out information screen returns the user to the appropriate Pin out menu screen.

Note: The information available on selecting Supply and Others is presented on two screens each. Pressing DOWN when the last item of the first screen of each is highlighted causes the second screen to appear with its first item highlighted. UP performs a similar function.

To leave the Pin out menu screens

- Cycle through the Pin out menu screens until the fourth screen is displayed. Use the UP and DOWN keys to select Exit and press ENTER to confirm.

Alternatively ...

- Repeatedly press STOP to go back level by level until the Main menu is displayed.

Pin out information is not relevant to the 620DiN IP66/NEMA 4X pump. Selecting Pin out details causes the pump to display a warning screen and redisplay the main menu.
19.19 Language

The pump can be set to operate in several languages.

- In the fifth screen of the Setup menu select **Language** using the **UP** and **DOWN** keys. Press **ENTER** to confirm.
- In the next screen, choose a language using the **UP** and **DOWN** keys. Press **ENTER** to confirm. The pump redisplay the fifth Setup screen in your chosen language. All screens will subsequently appear in your chosen language.

19.20 Defaults

All the pump’s user-set data can be reset to factory defaults.

- In the fifth screen of the Setup menu select **Defaults** using the **UP** and **DOWN** keys. Press **ENTER** to confirm.
- A warning is displayed for four seconds, and the pump asks the user to confirm that factory defaults are to be reset. Use the **UP** and **DOWN** keys to choose **Yes** if you wish the pump to reset all user-set data back to factory defaults (see 12 Switching the pump on for the first time); or **No** if you do not wish to do this. Press **ENTER** to confirm. If **Yes** was chosen, the pump resets its factory defaults and redisplays the fifth Setup screen. If **No** was chosen, the pump makes no changes to its setup and redisplays the fifth Setup screen.
19.21 Beep

The pump keypad can operate silently or indicate a positive key-press with a beep sound.

- In the fifth screen of the Setup menu select Beep using the UP and DOWN keys. Press ENTER to confirm.
- In the next screen, use the UP and DOWN keys to choose On or Off. Press ENTER to confirm your decision. The pump redisplay the fifth Setup screen.

Alternatively ...

- To toggle the sound on and off, stop the pump. Turn off the mains power switch at the rear of the pump.
- Depress the UP and 1 (DIRECTION) keys while switching on the mains power switch at the rear of the pump.
**19.22 Security code**

Access to the pump’s Setup and Calibration menus, direction control and keypad lock can be restricted to those who correctly enter a three-digit security code: the main code. A secondary user code can be set, which permits PIN access to calibration, direction and keypad lock, but blocks access to Setup. See 19 Setup, 18 Calibrate, 14.3 Direction and 14.4 Keypad lock.

The codes must first be set.

- In the sixth screen of the Setup menu select **Security code** using the **UP** and **DOWN** keys. Press **ENTER** to confirm.
- If no code has been set, a screen is displayed inviting the user to set a main code. Press **ENTER** to proceed (or **STOP** to return to the sixth screen of the Setup menu).
- If a main code has been set, a screen is displayed inviting the user to set a new main code, to set a user code (or a new user code if one has already been set), or to cancel all codes. Choose **Set main code, Set user code or Cancel codes** using the **UP** and **DOWN** keys. Press **ENTER** to confirm your choice.
- If you chose **Cancel codes**, any codes previously set are cancelled and access to the pump is not restricted.
- If you chose **Set main code** or **Set user code**, the pump displays a screen with three blank spaces for digits and the instruction "Enter new code". Use the numeric keys to enter three digits. The pump displays a similar three-digit entry screen and the instruction "Confirm code".
- Repeat the digit-entry sequence.
- If the second three-digit code entered differs from the first, or if the digits chosen as a user code are the same as those already set as a main code, the pump briefly displays an error message and redisplays the set code options screen.
- If the codes tally and, for a user code, if there is no clash with a previously set
main code, the pump briefly displays a confirmation message and redisplays the sixth Setup screen. Access to the Setup and Configuration menus, direction control and keypad lock is now protected by the new security code.

- If **STOP** is pressed during code entry, the pump returns the user to the sixth Setup screen. If **STOP** is pressed during code confirmation, the pump returns the user to the first digit-entry screen.

**Note**: A user code cannot be set unless a main code has previously been set. If you wish to cancel only a user code, you must use **Cancel codes** to cancel both user and main codes, then use **Set main code** to set a new main code.

**Note**: If a code has been set but forgotten, it is still possible to access the Setup screens to cancel the code or reset it to another three-digit number. Contact your supplier or Flexicon Technical support for the bypass sequence.

### 19.23 Exit

![Diagram of Security Code Exit](image)

- In the sixth screen of the Setup menu select **Exit** using the **UP** and **DOWN** keys. Press **ENTER** to confirm.
- The user is returned to the Main menu.
20 Automatic control wiring using the 620N module

Interfacing the pump with other devices is by means of screw-terminal connectors within the 620N watertight module at the rear of the pump. Suitable cable must be passed into the module through one or more watertight cable glands and connected appropriately. The module must be removed to allow this.

It is important to check that the pump’s voltage setting matches the supply. The voltage selection switch is on the rear panel of the drive. The module must be removed (and replaced) to allow it to be checked.

20.1 620N module removal and replacement

To remove the 620N watertight module:

The module is secured to the back of the drive unit by six M5x12 Pozidriv countersunk stainless steel screws.

- Remove the six screws using a suitable crosspoint screwdriver, leaving the top centre screw till last. Even when all screws have been removed, the sealing strip may cause the module to adhere to the drive. If so, a gentle tap will free it. Do not use a tool to lever it off.
- The sealing strip should be retained within its channel on the face of the module. The transparent on/off switch cover should be retained on its flange on the face of the module. Check the integrity of the seal and the transparent on/off switch cover. If either is damaged, it must be renewed to maintain ingress protection.
- If necessary, unplug the two 25-way D-connectors linking the module to the pump drive. If necessary, remove the module’s earth link from the back of the drive. However, the link is long enough to allow the module to fold back to give access to the circuit board inside and to the back of the drive.
To replace the 620N watertight module:

- Check that the fuse in the fuseholder (ringed) does not need to be replaced.
- Check that the voltage selector switch is correctly set.
- Check that the sealing strip is fully in its channel on the face of the module.
- Attach the module's earth link wire. Replace and tighten its screw to 2Nm.
- Push home the female (upper) and male 25-way D-connectors.
- Hold the module in place. Do not disturb the seal or pinch the earth link wire or D-connector ribbon cables, and screw in the retaining screws (top centre first). Tighten to 2.5Nm.

**Note:** The 620N module must be properly fitted using all six screws. Without them, the screw holes may corrode and IP66 (NEMA4X) protection will be compromised.

### 20.2 Wiring up

It is the user’s responsibility to ensure the pump’s safe and reliable operation under remote and automatic control.

This pump’s 0V lines are commoned and mains transformer-isolated from ground (floating ground). It can be connected to isolated 0V or grounded 0V interfaces.

Cable entry to the module is via up to four watertight cable glands. These may be fitted in place of the plugs which seal the module when the pump is shipped.

The number of glands needed depends on the number of connection cables required and the convenience of the installer. As standard, four M16 cable glands are provided with the pump.

Recommended control cables must be used for the terminal blocks: metric = 0.14sq mm - 2.5sq mm solid and 0.14sq mm - 1.5sq mm stranded. USA = 26AWG - 14AWG solid and 26AWG - 16AWG stranded. Cable: circular. Max/min outside diameter to ensure a seal when passed through the standard gland: 9.5mm-5mm. **The cable section must be circular to ensure a seal.**

![Warning: The recommended cable and cable glands must be used for the IP66 (NEMA 4X) version of this pump; otherwise ingress protection may be jeopardised.](image-url)

---

**Flexicon 620DiN, 620Di User Manual 76**
For EMC protection, shielded control cable should be used. The shielding should be terminated to one of the pcb mounting screws or to the adjacent spade connection (where fitted).

For improved EMC protection in extremely noisy environments, shielded cable may be used in conjunction with watertight EMC metal cable glands. These must be earthed to the module by adding an M16x1.5 nut with serrated edges to ensure proper contact with the inside of the module. It is necessary to remove the module's circuit board to access the interior of the module: it is held in place by two fixing screws which can be removed and replaced with a cross-point screwdriver. Take normal anti-static precautions when handling printed circuit boards.

Suitable cables for general-purpose use: 300V with extra premium grade PVC jacket with good flame and moisture resistance.

Suitable cables for industrial use: 300V extra-rugged polyurethane grade jacket with resistance to oils, fuels, solvents and water.

For convenience of wiring more than 8 conductors per cable may be awkward to handle. Only two appear in the illustrations here, for clarity.

- Use a 19mm spanner to unscrew the sealing plug. Discard the nylon sealing washer.
- Screw in one of the supplied M16x1.5 cable glands in place of the plug, using the new nylon sealing washer supplied. Tighten the gland to 2.5Nm to ensure a seal, using a 21mm spanner. If a different gland is used, it must be watertight to IP66.
- Loosen the gland cap (do not remove it) and pass the cable in through the gland. When it has passed through the gland, continue to push the cable through.
- The inside of the module is shaped to guide the cable past the printed circuit board inside. Continued pushing will feed in enough cable to grip inside the module with the fingers.
- Pull through sufficient cable to reach the connectors required. Leave a little slack.
- Strip the outer sheath as necessary and remove 5mm of insulation from the conductors. No tinning or ferrule is required. Note: If very stiff or large-diameter cable is used, it may be convenient to strip the outer sheath before passing
the cable’s conductors through the gland. However, to ensure a seal, cable with an undamaged sheath must be present within the gland when it is tightened.

- Twist a suitable length of the cable screen. Loosen one of the pcb retaining screws and wind the shielding round it. Secure the screen by refastening the screw. Alternatively, secure the cable screen to the adjacent spade connection (where fitted).

- Push the bared conductor into the square hole in the connector. When the conductor is fully in, tighten the retaining screw to hold it in place.

- When all conductors are in position, use a 21mm spanner to tighten the gland cap to 2.5Nm to ensure a seal. Alternatively, tighten the gland by hand until it is finger-tight and use a spanner to tighten it further by one-half a turn.

Do not strap the control and mains power cables together.

**620N watertight module pcb connectors:**

Never apply mains power to the terminals within the 620N module. Apply the correct signals to the terminals shown below. Limit signals to the maximum values shown. Do not apply voltage across other terminals. Permanent damage, not covered by warranty, may result. The maximum rating on the relay contacts of this pump is 30V DC; maximum load 30W. Note: Also suitable for low power: ie, 1mA at 5VDC minimum.
### RS485 settings

<table>
<thead>
<tr>
<th>Baud</th>

<td>8</td>
</tr>
<tr>
<td>Auto echo</td>
<td>On</td>
</tr>
</tbody>
</table>

Never apply mains voltage to the D-connectors. Apply the correct signals to the pins shown. Limit signals to the maximum values shown. Do not apply voltage across other pins. Permanent damage, not covered by warranty, may result.
Important: general instructions for remote control inputs

All remote control inputs can be wired in two ways:

Logic
A logic voltage between 5V TTL and 24V industrial logic may be wired to the input. The pump is configured to operate without modification anywhere in this range. Any of the 0V terminals - though preferably the 0V terminal associated with the desired input - is connected to the control device’s 0V to make the circuit. Low is equivalent to 0V. High is equivalent to 5V→24V.

Switch
A remote switch may be connected between the input and any positive voltage supply from the pump - though preferably the associated supply terminal. Do not use the 10V supply from the Rem-pot connector, however.
20.3 Run/stop input

Remote run/stop: connect a remote switch between the \text{i/p} terminal and the \text{+5V} terminal of the Run/stop i/p connector (J4). Alternatively a logic input may be applied to the \text{i/p} terminal, ground to the \text{0V} terminal. High input stops the pump, low input runs the pump. With no connection or with the switch open, the pump will default to running. To change or set the sense of the run/stop input, see 19.11 Remote stop in the Setup menu.

20.4 Direction input

To enable remote direction control and disable the DIRECTION (SHIFT, 1) key on the keypad, link the terminals of the Direction enable link connector (J6). Important: Apply no voltage whatever to the Direction enable link. Connect a remote switch between the \text{+5V} terminal and the \text{i/p} terminal of the Direction i/p connector (J2). Open switch for clockwise rotation, closed switch for counter-clockwise rotation. Alternatively a logic signal may be applied to the \text{i/p} terminal and the \text{0V} terminal of the Direction i/p connector (J2). Low input for clockwise rotation, high input for counter-clockwise rotation. With no connection the pump defaults to clockwise rotation.

20.5 Dose input

Connect a momentary contact switch such as a footswitch or a handswitch between the \text{5V} terminal and the \text{i/p} terminal of the Dose i/p connector (J3). Close the switch to begin a dose. This input is software-debounced and functions in a similar way to the other remote inputs, such as with 5V to 24V logic as shown above, using the \text{i/p} terminal and the \text{0V} terminal.

\textbf{Note:} This input is software-debounced, so the signal can be either momentary or maintained during the dose. If maintained, the signal must be removed before the next dose.

\textbf{Note:} Connect only one pump through one switch. If several pumps must be started at once, use multiple poles and isolate each circuit.
20.6 Leak detection input

Connect a remote leak-detection device between the +12V terminal and the i/p terminal on the Tube monitor connector (J9). Closed circuit indicates a leak. Alternatively a logic input may be applied to the i/p terminal, ground to the 0V terminal. High input indicates a leak. Connect the cable of a Watson-Marlow Tube monitor leak detector as follows:

<table>
<thead>
<tr>
<th>Tube monitor wire colour</th>
<th>620N module</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blue</td>
<td>J9 0V terminal</td>
</tr>
<tr>
<td>Yellow</td>
<td>J9 i/p terminal</td>
</tr>
<tr>
<td>Red</td>
<td>J9 +12V terminal</td>
</tr>
</tbody>
</table>

Terminate the screen in the 620N module with a 360° EMC gland if required. See 22.2 Wiring up.

Note: Use only Watson-Marlow Ltd 620 series tube monitors.

Important: pump status outputs

Outputs 1-4 are available as single-pole change-over relay contacts: Relay 1, 2, 3 and 4. Connect to the normally open or normally closed contacts of the relay as required and configure the pump’s software accordingly. See Outputs.

Note: The maximum rating on the relay contacts of this pump is 30V DC; maximum load 30W.

Note: Also suitable for low power: ie, 1mA at 5VDC minimum.

20.7 Outputs 1, 2, 3, 4

Note: Relay 1 (J14) is represented here. Relay 2, Relay 3 and Relay 4 (J15, J16 and J17) function identically.

Connect your output device to the c (common) terminal of your chosen relay connector and either the n/c terminal or the n/o terminal (normally closed or normally open) as required. Configure the pump’s software accordingly. See 19.10 Outputs.

By default, Relay 1 is configured to indicate Run/Stop status; Relay 2 is configured to indicate Direction status; Relay 3 is configured to indicate Auto/man status; Relay 4 is configured to indicate General alarm status. See 12 Switching the pump on for the first time.
20.8 Supply voltages

An appropriate voltage supply is available where required on each connector. In addition, supplies may be drawn from the Spare supplies connector (J12).

In the table below, "Max load" is the maximum total load on each supply, irrespective of the number of connections.

<table>
<thead>
<tr>
<th>DC Voltage</th>
<th>Max load</th>
<th>Typical use</th>
</tr>
</thead>
<tbody>
<tr>
<td>+5V</td>
<td>10mA</td>
<td>Voltage supply for inputs using remote switch. Possible voltage supply for outputs if only 5V is required.</td>
</tr>
<tr>
<td>+12V</td>
<td>10mA</td>
<td>Possible voltage supply for inputs using remote switch. Possible voltage supply for outputs. Voltage supply for Flexicon Tube Monitor leak detector. Part voltage supply (-12V also needed) for the Flexicon proximity switch.</td>
</tr>
<tr>
<td>-12V</td>
<td>10mA</td>
<td>Part voltage supply (+12V also needed) for the Flexicon proximity switch.</td>
</tr>
</tbody>
</table>

Note: All DC supplies are stabilised.

20.9 RS485 input

Connect your network link to J10 using a screened twisted pair: A to A, B to B, screen to 0V. Ensure that the pump is configured to operate under Network control. More than one pump may be controlled with the same RS485 signal: connect all pumps in parallel. See 22 Network control and operation.

The shorting link at J20 must be correctly positioned to allow RS485 control to function properly. Fit the shorting link of a single pump or of the last pump on a network line in the position marked INT on the three-pin header; fit the shorting link of all other pumps on the network line in the position marked EXT on the three-pin header.
21 Automatic control wiring without the 620N module

Interfacing the pump with other devices is by means of three D-connectors at the rear of the pump. There are two 25-way D-connectors. The top one is male, the bottom one is female. Mating female and male connectors, screened for EMC compatibility, must be conventionally soldered to screened control cables.

Recommended control cable: 7 strands 0.2mm, 24AWG, screened, circular, up to 25-core. The cable screen should be earthed either through the functional earth pin on the D-connector (pin 1 on the upper (male) 25-way D-connector) (pin 13 on the lower (female) 25-way D-connector), or through the metalwork of the socket or plug.

This pump passes all EMC compatibility requirements with up to 25m (82ft) of the cable type specified above. Beyond this distance it is the user’s responsibility to ensure the pump’s safe and reliable operation under remote and automatic control.

Do not strap the control and mains power cables together.

The 0V lines on this pump are mains transformer-isolated from ground (floating ground). It can be connected to isolated 0V or grounded 0V interfaces. The TTL (transistor transistor logic) outputs 1 and 2 used here are composed of two states: nominally 0V and 5V; but in practice <0.4V (<16mA) and 2.4-5V (<0.4mA). They are not suitable for driving relays. If a relay is to be driven by the TTL signal, it must be done as described under Logic output 1-4, below.
**RS232 control**

RS232 network control is available via a 9-pin D-connector wired as below.

RS232 is the mode which allows the pump to be controlled by computers and process controllers. It can control every function of the pump, and pass data back to the controller for closed loop operation. Up to 16 pumps can be individually controlled.

Recommended control cable: 7 strands 0.2mm, 24AWG, screened, circular, up to 4-core. The cable screen should be earthed through the metalwork of the shell.

This pump passes all EMC compatibility requirements with up to 3m (10ft) of the cable type specified above. Beyond this distance it is the user’s responsibility to ensure the pump’s safe and reliable operation under remote and automatic control.

The OV lines on this pump are mains transformer-isolated from ground (floating ground).

**Basic RS232 cabling**

A pc can control one pump using RS232 network cable 059.3121.000; or more than one pump using additional RS232 network extension cables 059.3122.000, up to a maximum of 16 pumps. If a connection must be made to a pc fitted with a 25-pin serial outlet, use RS232 network adaptor 059.3123.000, shown, dotted, left, instead of 059.3121.000.

![Warning](image)

*Never apply mains voltage to the D-connectors. Apply the correct signals to the pins shown. Limit signals to the maximum values shown. Do not apply voltage across other pins. Permanent damage, not covered by warranty, may result.*

**Important: general instructions for remote control inputs**

All remote control inputs can be wired in two ways:

**Logic**

A logic voltage between 5V TTL and 24V industrial logic may be wired to the input pin. The pump is configured to operate without modification anywhere in this range. Any of the 0V pins is connected to the control device’s 0V to make the circuit. One 0V pin is identified in the wiring diagram, but any may be used. Low is equivalent to 0V. High is equivalent to 5V→24V.

**Switch**

A remote switch may be connected between the input pin and any positive voltage supply from the pump. One 5V supply pin is identified in the wiring diagram but there are several which will do, either 5V or other positive voltage. However, do not use pin 21 on the lower D-connector or pin 20 on the upper D-connector.
21.1 Run/stop input

Remote run/stop: connect a remote switch between pins 7 and 19 of the lower D-connector. Alternatively a logic input may be applied to pin 7 of the lower D-connector, ground to pin 18. High input stops the pump, low input runs the pump. With no connection or with the switch open, the pump will default to running. To change or set the sense of the run/stop input, see 19.11 Remote stop in the Setup menu.

21.2 Direction input

To enable remote direction control and disable the DIRECTION (SHIFT, 1) key on the keypad, link pins 6 and 18 of the lower D-connector. Connect a remote switch between pins 5 and 19 of the lower D-connector. Open switch for clockwise rotation, closed switch for counter-clockwise rotation. Alternatively a logic signal may be applied to pin 5 of the lower D-connector, ground to pin 17. Low input for clockwise rotation, high input for counter-clockwise rotation. With no connection the pump defaults to clockwise rotation.
21.3 Dose input

Connect a momentary contact switch such as a footswitch or a handswitch between pins 8 and 9 of the lower D-connector. Close the switch to begin a dose. This input is software-debounced and functions in a similar way to the other remote inputs, such as with 5V to 24V logic as shown above, using pin 8 as the input and pin 20 as the 0V (lower D-connector).

**Note:** This input is software-debounced, so the signal can be either momentary or maintained during the dose. If maintained, the signal must be removed before the next dose.

**Note:** Connect only one pump through one switch. If several pumps must be started at once, use multiple poles and isolate each circuit.
21.4 Leak detection input

Connect a remote leak-detection device between pins 2 and 18 of the upper D-connector. Closed circuit indicates a leak. Alternatively a logic input may be applied to pin 2 of the upper D-connector, ground to pin 15. High input indicates a leak. Connect a Watson-Marlow leak detector in the same way, drawing 12V to power it from pin 21 of the upper D-connector.

Connect the cable of a Watson-Marlow Tube monitor leak detector as follows:

<table>
<thead>
<tr>
<th>Tube monitor wire colour</th>
<th>Pin number upper D-connector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blue</td>
<td>15</td>
</tr>
<tr>
<td>Yellow</td>
<td>2</td>
</tr>
<tr>
<td>Red</td>
<td>21</td>
</tr>
</tbody>
</table>

Note: Use only a Watson-Marlow 620 series tube monitor.
21.5 Pump status outputs

**Important: pump status outputs**

All four outputs can be configured in software to output a range of parameters: see Outputs under Setup.

Outputs 1 and 2 are available simultaneously from the upper and lower D-connectors. The outputs from the lower D-connector operate at 5V TTL only.

All four outputs available from the upper D-connector are open-collector.

By applying a positive voltage to a maximum of 24V to pin 22 of the upper D-connector, all the outputs from this plug are at that voltage: pin 22 is commoned with pins 23, 24 and 25. Care must be taken to ensure that the supply voltage has sufficient capability to drive all the loads applied to all outputs used. **Important: The total load of the four logic outputs must not exceed 50mA.**

21.5.1 Logic output 1

Output 1 is taken from pin 10 of the upper D-connector, depending on the logic state of the function assigned to Output 1. Alternatively, a load such as a relay coil may be connected to pin 10, ground to pin 17. Current will flow through the circuit depending on the logic state of the function assigned to Output 1. Do not connect to any device requiring more than 50mA.

Additionally, output 1 is available as a 5V TTL logic signal on pin 10 of the lower D-connector. It will change state corresponding to the logic state of the function assigned to Output 1. Do not connect to any device requiring more than 1 TTL load.

By default, output 1 is configured to indicate Run/Stop status. See 12 Switching the pump on for the first time.
21.5.2 Logic output 2

Output 2 is taken from pin 11 of the upper D-connector, depending on the logic state of the function assigned to Output 2. Alternatively, a load such as a relay coil may be connected to pin 11, ground to pin 17. Current will flow through the circuit depending on the logic state of the function assigned to Output 2. Do not connect to any device requiring more than 50mA.

Additionally, output 2 is available as a 5V TTL logic signal on pin 11 of the lower D-connector. It will change state corresponding to the logic state of the function assigned to Output 2. Do not connect to any device requiring more than 1 TTL load.

By default, output 2 is configured to indicate Direction status. See 12 Switching the pump on for the first time.
21.5.3 Logic output 3

Output 3 is taken from pin 13 of the upper D-connector, depending on the logic state of the function assigned to Output 3. Alternatively, a load such as a relay coil may be connected to pin 13, ground to pin 17. Current will flow through the circuit depending on the logic state of the function assigned to Output 3. Do not connect to any device requiring more than 50mA.

By default, output 3 is configured to indicate Auto/Man status. See 12 Switching the pump on for the first time.

21.5.4 Logic output 4

Output 4 is taken from pin 12 of the upper D-connector, depending on the logic state of the function assigned to Output 4. Alternatively, a load such as a relay coil may be connected to pin 12, ground to pin 17. Current will flow through the circuit depending on the logic state of the function assigned to Output 4. Do not connect to any device requiring more than 50mA.

By default, output 4 is configured to indicate General alarm status. See 12 Switching the pump on for the first time.
21.6 Supply voltages

In the table below, "Max load" is the maximum total load on each supply irrespective of the number of connections.

<table>
<thead>
<tr>
<th>DC Voltage</th>
<th>Max load</th>
<th>Lower D</th>
<th>Upper D</th>
<th>Typical use</th>
</tr>
</thead>
<tbody>
<tr>
<td>+5V</td>
<td>10mA</td>
<td>9, 19, 23</td>
<td>18, 19</td>
<td>Voltage supply for inputs using remote switch. Possible voltage supply for outputs if only 5V is required. Pin 9 is specifically used for footswitch / handswitch operation</td>
</tr>
<tr>
<td>+12V</td>
<td>10mA</td>
<td>25</td>
<td>21</td>
<td>Possible voltage supply for inputs using remote switch. Possible voltage supply for outputs. Voltage supply for Flexicon Tube Monitor leak detector. Part voltage supply (-12V also needed) for the Flexicon proximity switch</td>
</tr>
<tr>
<td>-12V</td>
<td>10mA</td>
<td>24</td>
<td>-</td>
<td>Part voltage supply (+12V also needed) for the Flexicon proximity switch</td>
</tr>
<tr>
<td>+22.5V</td>
<td>-</td>
<td>20</td>
<td></td>
<td>Voltage supply for the 620N washdown module. Do not use</td>
</tr>
</tbody>
</table>

**Note:** All DC supplies are stabilised except the +22.5V.
22 Network control and operation

Check that the pump is ready to run before selecting network operation. Remote control signals may start the pump without warning.

How to get into network operation

- Use the **UP** and **DOWN** keys to select **Network** from the Main menu. Press **ENTER** to confirm.
- The pump enters Network (RS232 or RS485) mode and is under network control.
- Auto-restart is switched on and the pump displays the (!) icon.
- The only keys active are **STOP** and **SHIFT, 9 (INFO)**.
- Remote stop, Net/man, Direction enable and Direction inputs are inactive. Leak and Dose inputs are active. See 24.1 Error codes.
- All pump status outputs are active.

How to get out of network operation

- Pressing the **STOP** key displays three options: **Continue**, **Manual** and **Menu**. Use the **UP** and **DOWN** keys to choose and press **ENTER** to confirm.
- Selecting **Continue** returns the pump to network (RS232 or RS485) mode.
- Selecting **Manual** sets the pump to manual operation and retains the set speed and run status from its previous operation in Network mode. See 14 Manual operation.
- Selecting **Menu** displays the Main menu (see 15 Main menu).

Emergency stop

- In an emergency press the **STOP** key. The pump stops and displays an interruption screen, from which select **Continue** to return to network control, **Manual** to set the pump to manual control (see 14 Manual operation), or **Menu** to display the main menu (see Main menu). Use the **UP** and **DOWN** keys to choose and press **ENTER** to confirm.
### 22.1 RS232 and RS485 command strings

<table>
<thead>
<tr>
<th>Command</th>
<th>Parameters</th>
<th>Meaning</th>

</tr>
<tr>
<td>nPD?</td>
<td>0Di,*,#,a,b,c,d,e,f,g,h,i,j</td>
<td>Query dose parameters. See note 9</td>
</tr>
<tr>
<td>nPA</td>
<td>-</td>
<td>Query all dose program parameters. See note 8</td>
</tr>
<tr>
<td>nCC</td>
<td>-</td>
<td>Clear the batch count</td>
</tr>
<tr>
<td>nSC</td>
<td>-</td>
<td>Responds with ccccc ! This is the number of complete doses which have been started via the RP command, delivered since the last PD command</td>
</tr>
<tr>
<td>nRP</td>
<td>-</td>
<td>Runs the programmed dose and increments the batch count. See note 9</td>
</tr>
<tr>
<td>nLP</td>
<td>xxxxxxxxx</td>
<td>This allows a saved program to be recalled from NVRAM. The program name is a string of 8 characters precisely. Unused positions must be padded with spaces (ASCII 32)</td>
</tr>
<tr>
<td>nCB</td>
<td>xx.xxx</td>
<td>Parameter is a fixed point number representing the new calibration in ml/rev</td>
</tr>
<tr>
<td>nD?</td>
<td>-</td>
<td>Reports last full dose dispensed. See note 11</td>
</tr>
<tr>
<td>nCF</td>
<td>######</td>
<td>Calibration-on-the-fly new dose value, subject to the ±25% rule. See note 12</td>
</tr>
</tbody>
</table>
**Note 1**: The correlation between tachometer pulses and motor rotation is fixed and provides a measurable and absolute way of monitoring the number of revolutions of the gearbox output shaft - 10,982 pulses per revolution. This in turn allows the count to be equated to the amount of material dispensed - assuming that the pumphead type and tube size are known.

**Note 2**: The status is returned to the sender in the following format: [pump type] [ml/rev] [pumphead] [tube size] [speed] [CW/CCW] P/N [pump number] [tacho count] [0/1 (stopped/running)]!
For example: 620Du 15.84 620R 9.6MM 220.0 CW P/N 1 123456789 1!

**Note 3**: If the pump speed is changed subsequently, the pump must display the screen shown here (example figures only) for 4 seconds before reverting to the custom display. 1 to 4 lines of text can be written with ~ as the line delimiter and @ as the message end. i.e., 1W620Du@ and 1W620Du~@ are both valid commands.

**Note 4**: ‘n’ can be any number from 1 to 16 inclusive (1 to 32, 620DuN), and by exception the # symbol can be used as an all-drives command; but not with the RS, RT or ZY commands, as the results would be indeterminate.

**Note 5**: The dose parameters are all required, except that SG is only required for dosing by mass, and are variable in length, separated by commas. Missing or illegal characters will cause the command to be aborted and an error message generated on the display. See the table right for an explanation of the expected parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Range</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>1-9999</td>
<td>Number of doses</td>
</tr>
<tr>
<td>b</td>
<td>[A C]</td>
<td>Rotation: counterclockwise or clockwise</td>
</tr>
<tr>
<td>c</td>
<td>0-999</td>
<td>Interval in seconds: eg 1.0</td>
</tr>
<tr>
<td>d</td>
<td>0001-3500</td>
<td>Pump speed: tenths of an rpm</td>
</tr>
<tr>
<td>e</td>
<td>0-5</td>
<td>Start ramp: scale factor</td>
</tr>
<tr>
<td>f</td>
<td>0-5</td>
<td>End ramp: scale factor</td>
</tr>
<tr>
<td>g</td>
<td>0.0-1.0</td>
<td>Drip: rev</td>
</tr>
<tr>
<td>h</td>
<td>0.001-9999</td>
<td>Dose size: eg 10.00</td>
</tr>
<tr>
<td>i</td>
<td>[ l m u g kg floz pts gals oz lb ]</td>
<td>Dose unit: litres, ml, ml, grams, kg, fluid ounces, pints, gallons, ounces, pounds</td>
</tr>
<tr>
<td>j</td>
<td>0.01-15</td>
<td>Specific gravity: eg 1.00</td>
</tr>
</tbody>
</table>

**Note 6**: No response will be given and the PD? command should be issued to ensure that the command has been accepted. These values will become the current dispense program, as set up in dose mode, overwriting the current values. This command resets the batch count.

**Note 7**: This command elicits the response 620Di,*,#a,b,c,d,e,f,g,h,i,j! where the * is the head type and the # is the calibration value in ml/rev. The remaining parameters are defined above.
Note 8: This invokes the response P PPPPPP,**,#,a,b,c,d,e,f,g,h,i,j ! for each dose program saved on pump id = n. The format of this string is the 8-character program name (padded with spaces), followed by the normal dose query parameters, without the pump type identifier.

Note 9: The run dose command allows a dose program, set using PD or DO, to be initiated. It also allows the current dispense program, set up in dose mode via the keypad, to be initiated. Normal dose status messages will not be produced; instead a single 'Start' message will be sent back in response, with the following format: P/N [id] [date] [time] Program Started ! For example: P/N 01 08.12.00 11.28.00 Program Started !
On completion of a single dose, the batch count will be incremented by one.

Note 10: If a change speed command is issued while the dose is active the change will not be effected until the current dose is completed.

Note 11: The dose dispensed is a value in the form ***** !
For example: 30.45 !

Note 12: If a value is outside the ±25% rule, an error message is sent back in a string terminated by !. It uses the existing calibration value.

### 23 Connecting a computer

A computer may be connected to the pump using a nine-pin D-connector wired as shown under Network control and operation. See 21 Automatic control wiring without the 620N module.

**Note:** Computer output is not available when the pump is under network control.
24 Troubleshooting

If the pump display remains blank when the pump is on, make the following checks:

- Check the position of the voltage selector switch at the rear of the pump.
- Check the mains power switch at the rear of the pump.
- Check that mains power is available to the pump.
- Check the fuse in the fuseholder in the centre of the switchplate at the rear of the pump.
- Check the fuse in the mains power plug if one is present.

If the pump runs but there is little or no flow, make the following checks:

- Check that the tube and rotor are in the pumphead.
- Check that fluid is supplied to the pump.
- Check that the tube is not split or burst.
- Check for any kinks or blockages in the lines.
- Check that any valves in the lines are open.
- Check that the correct wall-thickness tube is being used.
- Check direction of rotation.
- Check that the rotor is not slipping on the drive shaft.
24.1 Error codes

If an internal error occurs, a flashing error screen is displayed. **Note:** **Signal out of range, Over signal, No signal** and **Leak detected** error screens report the nature of an external signal. They do not flash.

</tbody>
</table>
25 Drive maintenance

There are no user serviceable parts inside the pump. The unit should be returned to Watson-Marlow Ltd or its appointed agents or distributors for service.

26 Drive spares

| Replaceable main fuse, type T5A H 250V: FS0043 | Foot: MR3002M x5 |
27 620RE MarkII, 620RE4 MarkII and 620R MarkII pumpheads

Note: MarkII pumpheads differ from MarkI pumpheads as follows: they have a new guard-switching arrangement which is not compatible with 623/624 drives. Similarly, older guards are incompatible with 620 drives. Elsewhere in this manual, the term “MarkII” is omitted.

27.1 620RE, 620RE4 and 620R key safety information

- Ensure that the pump is isolated from mains voltage.
- Ensure that there is no pressure in the pipeline.
- If a tube failure has occurred, ensure that any product in the pumphead has been allowed to drain through the controlled waste to a suitable drain.
- Ensure that protective clothing and eye protection are worn if hazardous products are being pumped.

27.2 620RE, 620RE4 and 620R safe-guarding

- Primary safety on 620 series pumps is provided by the tool-lockable pumphead guard. Secondary (backup) protection is provided in the form of an electrical guard switch which stops the pump if the pumphead guard is opened. The electrical guard switch on cased pumps should never be used as primary protection. Always disconnect the mains power supply to the pump before opening the pumphead guard.
27.3 620RE, 620RE4 and 620R
pumping conditions

Pressure and viscosity

- All pressure values in this operating instruction, from which performance and life figures have been calculated, relate to peak pipeline pressures.
- Although rated to 4 bar peak pressure, this pump will generate in excess of 4 bar peak pressure if pipeline restrictions are in place. In instances where it is critical that a peak pressure of 4 bar is not exceeded, pressure relief valves should be installed in the pipeline.
- For pumping duties of 2-4 bar pressure, fit hard Marprene/Bioprene or standard Sta-Pure or Chem-Sure tube elements. "M" or "P" in the tube element's product order code denotes suitability for higher pressure use.
- For pumping duties of 0-2 bar pressure, use standard hardness elements or the standard range of continuous peristaltic pump tubing.
- Viscosity handling is maximised by using hard Marprene/Bioprene or Sta-Pure tube elements in the pumphead.
- Ensure that there is always a minimum of one metre of smooth bore flexible tubing connected to the discharge port of the pumphead. This will help minimise any impulse losses and pulsation in the pipeline. This is especially important with viscous fluids and rigid pipework.

27.4 620RE, 620RE4 and 620R
pump installation

A correctly engineered installation will promote the best possible tube life, so please ensure that the following guidelines are followed:

- Avoid tight pipeline bends, pipe reducers and excessive lengths of smaller bore tubing than that in the pumphead, particularly in pipelines on the suction side.
- Ensure that connecting pipe work and fittings are suitably rated to handle the predicted pipeline pressure.
- If rigid pipe work comes in close proximity to the pumphead, a drop-out section of pipe work will simplify tube replacement.
- Ensure that the controlled waste blanking plug is in position if the controlled waste port is not in use. See below.
- It is advisable to use controlled waste pipe work if pumping hazardous, aggressive or abrasive fluids or products which will harden in contact with air.

- Connect waste pipe work to the waste port using the coupling adaptor supplied.
- Push out the blanking plug. Drop the threaded waste fitting into place. Secure it with the supplied locking nut. Fully tighten by hand. Ensure that there is adequate clearance underneath the pumphead. Waste pipe work should run to a suitable container or drain.
- The leak detector installation procedure is included in the leak detector kit.
- If unsure of an installation please contact your local Technical Support Office.
27.5 620RE, 620RE4 and 620R general operation

Always isolate the pump from the mains power supply before opening the guard or performing any positioning, removal or maintenance.

Opening the pumphead guard

- Unlock the guard with the 5mm Allen key provided (or a screwdriver).
- Open the guard to its full extent. This creates the maximum clearance between the tube ports and guard to remove the tubing.

Engaging/disengaging the rollers

- The extent of travel of the roller release levers is clear from pictures 2 and 3 above. Do not try and force the levers beyond their normal extent of travel as this will damage the rotor.
- To engage the rollers snap the roller release levers counter-clockwise making sure that the rollers lock out against the tubing. To disengage the rollers, snap the release levers clockwise to their disengaged position. For high pressure tubing elements or four roller pumpheads, a 5mm Allen key can be used to aid leverage when engaging/disengaging the rollers with the release levers.

Make sure that fingers are clear of the rollers and the front face of the rotor hub when using the roller release levers.

Pre-load checks

- Before loading tubing, ensure that all rollers rotate freely, that the tube ports and location grooves are clean and that if in use, the controlled waste pipe work is free of any obstructions.

Closing the pumphead guard and start-up

- Ensure that the guard seal is clean, replacing it if necessary.
- Ensure that the rollers are engaged and locked out against the tubing
- Close the guard and push it against the track until the latch engages.
- Connect suitable pipe work to the pumphead using the appropriate connectors for the tube element. See below.
27.6 620RE and 620RE4
tube element loading

620RE element pumpheads are factory set to accept Watson-Marlow LoadSure tube elements. Pumping performance will be adversely affected if LoadSure elements are not used.

- Open the guard using a suitable screwdriver or a 5mm Allen key. Disengage the rollers.
- Locate one of the "D"-shaped flanges into the lower port. (The "D" flange ensures that the element can only be loaded correctly).
- Wrap the tube element around the disengaged rollers of the rotor.
- Locate the second "D"-shaped flange into the upper port.
- Ensure the flat face of each "D" flange sits flush to the flange sealing face of the track.
- Engage the rollers.
- Close the guard and push it against the track until the latch engages.

Connecting LoadSure elements to supply and discharge tubes

LoadSure sanitary elements - which have white connectors - are connected to a tubing system using Tri-clamps and EPDM gaskets.

- Hold the connector end of the supply or discharge tube against the element connector, with an EPDM gasket between them.
- Use a Tri-clamp to engage both flanges squarely, close it and tighten.
LoadSure industrial elements - which have black connectors - are connected to a tubing system using cam-lock (cam and groove) fittings.

- Push the female fitting over the element connector.
- Pull both cam levers closed until they engage.

### 27.7 620R continuous tube loading

**Always isolate the pump from the mains power supply before opening the guard or performing any positioning, removal or maintenance.**

- 620R continuous tubing pumpheads are factory set to accept Watson-Marlow 600 series 3.2mm wall tubing. Pumping performance will be adversely affected if Watson-Marlow tubing is not used.
- Select the tube clamp set which is correct for the tubing size to be used.
- Locate the two "U"-shaped track clamp halves into the pumphead ports (The "U"-shape ensures correct loading).
- Locate the corresponding guard clamp halves which have raised "T" locating sections, into the slots on the inner guard face above and below the guard hinge. Push and slide into their locked position.
- Closing the guard will align the two halves of the clamp around the tubing.
- Disengage the rollers.
- Locate one end of the tubing into the lower port "U" clamp and hold firmly in position.
- Wrap the tubing tightly around the retracted rollers, making sure that there is no twisting through its length.
- Locate the other end of the tubing into the upper port "U" clamp.
- Hold both ends of the tubing in one hand maintaining tension around the retracted rollers.
- Engage the rollers.
Close the guard and push it against the track until the latch engages.
Ensure that continuous tubing is not loosely clamped at the pumphead ports.
Ensure that when the pump is re-started all of the rollers have re-engaged. A roller which has not re-engaged will "click" continuously. No damage will occur if this happens but the roller should be re-engaged manually using the 5mm Allen key. See 24 Troubleshooting.

27.8 620RE, 620RE4 and 620R tube element or continuous tube removal

Unlock the guard and disengage the rollers.
Disconnect the tubing from the external pipeline.
Remove the tubing from the pumphead.

27.9 620RE, 620RE4 and 620R maintenance

Scheduled maintenance

- The stainless steel pumping rollers run on sealed bearings and do not require lubrication.
- Remove the rotor and lubricate the follower rollers and roller engaging mechanisms with a lithium-based grease. This should be carried out every six months for intermittent duties and every three months for 24 hour duties.
- If fluid is spilled inside the pumphead, flush the pumphead out with water and mild detergent as soon as possible. If specific cleaning agents are required to clean the spillage, please consult Watson-Marlow Ltd Technical Support Office before proceeding, in order to confirm chemical compatibility.
- If the rotor needs to be removed, refer to the guidelines below.

Roller adjustment

620 pumpheads have provision for adjustment to reset the roller/track gap to compensate for wear after extended service in arduous applications.

Roller/track gaps can only be accurately judged without tubing in the pumphead. The gap should be 4.6mm for 3.2mm wall tubing and 5.5mm for LoadSure elements.

If the gap is more than 0.2mm greater than these dimensions, the following may be carried out:

- Note the number on the roller arm to which the engraved line on the hexagon-headed main roller pin corresponds.
- Remove the circlip (snap-ring) and roller pin.
- Relocate the main roller pin, resetting the engraved line to one number lower. For example, if the engraved line was at “-1”, reset it to “-2” to reduce the roller/track gap.
Ensure the roller pin is correctly seated into the roller arm thrust washer. Replace the circlip.

**Rotor removal**

- Remove the rotor cover by hand and the central locating bolt using a 5mm Allen key. Pull the rotor off the keyed shaft. Do not use tools to lever the rear face of the rotor away from the inner face of the track: it should come off by hand.

**Track removal**

- Remove the rotor as described above.
- Disconnect the waste pipework (if attached).
- Loosen the two track retaining screws using a suitable screwdriver.
- Withdraw the track fully from the gearbox.
- After removing the rotor and track, it is advisable to remove the metal key from the keyway, clean and reassemble. The key fits its keyway tightly. It may be freed by tapping gently with a screwdriver or other suitable tool.
Track re-location

- Ensure that the track is clean.
- Align the track so that the location holes are aligned with the threaded holes in the cased drive.
- Tighten the two track retaining screws using a suitable screwdriver.
- Re-connect the waste pipework (if required).

**Note**: The track can be fitted in two positions: with ports to the right or with ports down. The ports-down position requires that the pump is positioned at the front of the surface it stands on to provide clearance for the supply and discharge tubes.

Rotor re-location

- Before replacing the rotor, locate the key into the driveshaft keyway and apply a thin layer of grease over the shaft and key. The rotor keyway is the largest of the four slots radiating from the driveshaft socket: the top one in the first picture, above. Align the rotor keyway with the shaft key and slide the rotor into position, ensuring that a positive "stop" is achieved and ensure that the full length of the drive shaft is fitted into the rotor.
- Do not force the rotor into position. The rotor will slide into place easily if correctly aligned.
- Secure the rotor with the hexagonal locating bolt (complete with washer) to a nominal torque of 10Nm using a 5mm Allen key.
- The rotor bolt, which is impregnated with "Loctite 218" thread lock, should be subjected to a maximum of three removals/relocations before renewal. To avoid rotor bolt renewal after three removals, apply "Loctite 222" thread lock to the rotor thread before relocation. This is critical to ensure prolonged, secure location of the rotor hub to the drive shaft. **Failure to complete this action will invalidate the terms and conditions of the warranty.**
- Replace the rotor cover.

When closing the guard, check it does not make contact with the rotor. If it does, the rotor has been fitted incorrectly. Re-open the guard, remove and refit the rotor, and close the guard.
27.10 620RE, 620RE4 and 620R CIP and SIP

General

- Unlock the guard and disengage the rollers.
- Close the guard and squeeze against the track until the latch clicks.
- Observe a 1m safety area.

CIP

- LoadSure tube elements and continuous tubing can be cleaned using CIP processes.
- Ensure that the tubing material is chemically compatible with the cleaning agent that is to be used.
- If cleaning agents are spilled over the pumphead, wash down immediately.
- Ensure that controlled waste pipe work is fitted to allow safe release of cleaning agent in the event of a tube failure.

SIP

- Only Sta-Pure tube elements can be used in a steam-in-place sterilisation processes.
- Sta-Pure tubing elements can be sterilised to 3A Class two and FDA minimum recommended standard which is 121C (250F) at 1bar (14.5 psi) saturated steam for 20 minutes.
- Monitor the process continuously.
- If a tube failure occurs, shut down the process. Do not touch the pumphead until a 20 minute cooling period has been observed.
- Ensure a 20 minute acclimatisation period is observed before running the pump following SIP.
- Ensure that controlled waste pipework is fitted to allow a safe release of steam in the event of a tube failure.
- Ensure a 1m safety zone is maintained around the pumphead during SIP cycles.
27.11 620RE, 620RE4 and 620R pumphead spares

Ensure that the pumphead door is closed and locked before SIP cleaning commences.

28 620RE, 620RE4 and 620R performance data

Pumping conditions

All performance figures in this operating instruction have been recorded against peak pipeline pressures.

This pump is rated to 4 bar (58psi) peak pressure when fitted with a 620RE, 620RE4 or 620LG pumphead using high-pressure tubing. However, it will generate in excess of 4 bar (58psi) peak pressure if the pipeline is restricted. Where it is important that 4 bar (58psi) is not exceeded, pressure relief valves should be installed in the pipeline.

Viscosity handling is maximised by using 4.0mm wall LoadSure elements with the 620RE and 620RE4 pumpheads.

Flow rates are normalised test values obtained using new tubing with the pumphead rotating clockwise pumping water at 20°C with negligible inlet and discharge pressures. Actual flow rates achieved may vary because of changes in temperature, viscosity, inlet and discharge pressures, system configuration and tubing performance against time. Flow rates may also vary due to normal manufacturing tolerances of the tubing. These tolerances will make flow rate variance more pronounced at smaller bore sizes.

For precise and repeatable performance it is important to determine flow rates under operating conditions for each new piece of tubing.

620R and 620L family pumpheads' flow rates are directly proportional to rotor speed. If you wish to run the pump at a speed not shown in the tables below, flow figures can be reached by dividing the maximum flow shown in the tables below by the maximum rpm figure, and multiplying the result by your required speed in rpm.

In normal circumstances, rotor and tube life are maximised if the pumphead is run slowly, particularly when pumping at high pressure. However, to maintain performance at pressures above 2 bar, avoid running the pumphead below 50rpm. If low-flow, high-pressure operation is necessary, switching to a smaller tube is recommended.

Sta-Pure and Marprene TM tubing are hard to compress when new. When using tubing made of these materials, the first five pumphead revolutions should be at a speed of 10rpm or greater. If the pump is run slower, the safety system built into pump drive's software may cause it to stop and display an over-current error message.

Note: Flow rates quoted have been rounded for simplicity, but are accurate to within 5% - well within the normal tubing tolerance variation of flow rate. They should therefore be taken as a guide. Real flow rates in any application must be determined empirically.

**Note:** = for 4 bar use
31 620L and 620LG pumpheads

The twin offset track design of the 620L utilises 4.0mm wall double-Y tube elements to overcome pulsation for accurate dosing and dispensing. The 620L accepts Silicone and Marprene tubing up to 16.0mm bore.

Alternatively the 620L will run with two separate 4mm-wall tubes although some channel-to-channel variance and minimal pulsation may be experienced. For separate tube fitting or twin tube inlet to single tube outlet fitting tube clamping blocks must be used. See 31.8 620L pumphead spares.

31.1 620L and 620LG key safety information

Before opening the pumphead guard please ensure that the following safety directions are followed.

- Ensure that the pump is isolated from mains voltage.
- Ensure that there is no pressure in the pipeline.
- If a tube failure has occurred, ensure that any product in the pumphead has been allowed to drain.
- Ensure that protective clothing and eye protection are worn if hazardous products are being pumped.

31.2 620L and 620LG Guarding

- Primary safety on 620 series pumps is provided by the tool-lockable pumphead guard—in the case of the 620L and 620LG heads, the tool-lockable pumphead track functions as the guard. Secondary (backup) protection is provided in the form of an electrical guard switch which stops the pump if either end of the track is opened. The electrical guard switch on cased pumps should never be used as primary protection. Always disconnect the mains power supply to the pump before opening the pumphead.
31.3 620L and 620LG pumping conditions

Pressure and viscosity

- All pressure values in this operating instruction, from which performance and life figures have been calculated, relate to peak pipeline pressures.
- Although rated to 4 bar peak pressure, the 620LG may generate in excess of 4 bar working pressure if pipeline restrictions are in place. In instances where it is critical that a working pressure of 4 bar is not exceeded, pressure relief valves should be installed in the pipeline.

<table>
<thead>
<tr>
<th>620L</th>
<th>0-2 bar</th>
<th>Y element or continuous tubing</th>
</tr>
</thead>
<tbody>
<tr>
<td>620LG</td>
<td>0-4 bar</td>
<td>Sta-Pure and Chem-Sure Y elements only</td>
</tr>
</tbody>
</table>

- Ensure that there is always a minimum of one metre of smooth bore flexible tubing connected to the discharge port of the pumphead. This will help minimise any impulse losses and pulsation in the pipeline. This is especially important with viscous fluids and rigid pipework.

31.4 620L and 620LG removal and installation

A 620 pump supplied with a 620L pumphead is not intended for use with any other pumphead. However, the pumphead can be removed for cleaning or maintenance.

Always isolate the pump from the mains power supply before opening the guard or performing any positioning, removal or maintenance.
To remove the 620L pumphead

- To remove the pumphead you must first remove the track. The track is secured to the pumphead by cams positioned at its left and right. Where the cam shafts are visible at the front of the pumphead, they are milled square to accept a spanner. Use the 10mm or 3/8in AF spanner provided to rotate the right-hand cam shaft through 180 degrees counter-clockwise, and the left-hand camshaft through 180 degrees clockwise. The position of the cam rotation stops indicate when they are fully closed (third picture, left) and open (right). Lift off the track.
- The pumphead is secured to the black adaptor plate by two M6 screws. Use a 5mm Allen key to remove them. Lift off the pumphead.

It is not normally necessary to remove the adaptor plate. However, if it must be removed for cleaning:
- The adaptor plate is secured to the drive by four M6 screws. Use a suitable screwdriver to remove them. Lift off the adapter plate. After cleaning, reposition and secure it in the same way.

To install the 620L pumphead

- Clean and grease the projecting dog of the drive shaft. Position the cleaned pumphead so that it engages with the drive-shaft dog. Use two M6 screws to secure the pumphead to the adaptor plate.
- Reverse the directions above to reposition the track.
31.5 620L and 620LG Tube loading

Double-Y elements for low-pulsation flow and dispensing applications

- See illustrations at 31.4 620L removal and installation. The track is secured to the pumphead by cams positioned at its left and right. Where the cam shafts are visible at the front of the pumphead, they are milled square to accept a spanner. Use a 10mm or 3/8in AF spanner to rotate the right-hand cam shaft through 180 degrees counter-clockwise, and the left-hand camshaft through 180 degrees clockwise. The position of the cam rotation stops indicate when they are fully closed (third picture, left) and open (right). Lift off the track.

- Locate one end of double-Y element over one of the 625L clamping pegs. Stretch the element over the rotor and locate the other end of the element over the second 625L clamping peg. Replace the track as described at 33.4 620L removal and installation.

Twin inlet tubes for best handling of viscous fluids

- See illustrations at 31.4 620L removal and installation. The track is secured to the pumphead by cams positioned at its left and right. Where the cam shafts are visible at the front of the pumphead, they are milled square to accept a spanner. Use a 10mm or 3/8in AF spanner to rotate the right-hand cam shaft through 180 degrees counter-clockwise, and the left-hand camshaft through 180 degrees clockwise. The position of the cam rotation stops indicate when they are fully closed (third picture, left) and open (right). Lift off the track.

- Unscrew and remove the 625L inlet clamping peg. Connect the twin inlet tubes and outlet tube using the appropriate Y-piece connector and clips. Fit the inlet tubes into the correct size clamping block. Locate the Y-piece end of the ele-
ment over the 625L clamping peg. Stretch the tubes and screw the clamping block into place. Replace the track as described at 31.4 620L removal and installation.

**Two independent tubes for twin-channel pumping**

- See illustrations at 31.4 620L removal and installation. The track is secured to the pumphead by cams positioned at its left and right. Where the cam shafts are visible at the front of the泵head, they are milled square to accept a spanner. Use a 10mm or 3/8in AF spanner to rotate the right-hand cam shaft through 180 degrees counter-clockwise, and the left-hand camshaft through 180 degrees clockwise. The position of the cam rotation stops indicate when they are fully closed (third picture, left) and open (right). Lift off the track.

- Unscrew and remove the 625L clamping pegs. Clamping blocks will be used to secure the continuous tube, using the same screw sockets. Fit the two tubes into the correct size clamping blocks. Distance between blocks = 230mm for up to 8.0mm bore; 240mm for 12.0mm and 16.0mm bore. Fit the inlet tube clamping block to the 625L. Stretch the tubes over the rotor and fit the second tube clamping block to the 625L. Replace the track as described at 33.4 620L removal and installation. When using Marprene it is important to check the tube length after 30 minutes running time.

### 31.6 620L and 620LG care and maintenance

Check all moving parts for freedom of movement occasionally. If aggressive fluids are spilt onto the pumphead, clean using a mild detergent only.

### 31.7 620L and 620LG track adjustment

The track is set for 4.0mm wall tubing up to 16.0mm bore. Alteration of this setting using the pan head screws may be necessary to optimise performance if non-standard tubing is used. **However, the pump warranty will be invalidated if this is done.** The factory setting is 20.3mm vertically from the rotor side of the sprung track to the top of the track cover.

# 37 Decontamination certificate

In compliance with the UK Health and Safety at Work Act and the Control of Substances Hazardous to Health Regulations, you are required to declare the substances which have been in contact with product(s) you return to Watson-Marlow Ltd or its subsidiaries or distributors. Failure to do so will cause delays. Please ensure that you fax us this form and receive an RGA (Returned Goods Authorisation) before you despatch the product(s). A copy of this form must be attached to the outside of the packaging containing the product(s). Please complete a separate decontamination certificate for each product. You are responsible for cleaning and decontaminating the product(s) before return.
