1 Declaration of conformity

This declaration was issued for Watson-Marlow 620UN, 620U, 620SN and 620S pumps on September 19, 2005. When this pump unit is used as a stand-alone pump it complies with: Machinery Directive 2006/42/EC, EMC Directive 2004/108/EC.

This pump is ETL listed: ETL control number 3050250. Cert to CAN/CSA std C22.2 No 61010-1. Conforms to UL std 61010A-1.

See 8 Pump specifications.

2 Declaration of incorporation

When this pump unit is to be installed into a machine or is to be assembled with other machines for installations, it must not be put into service until the relevant machinery has been declared in conformity with the Machinery Directive 2006/42.

Responsible person: Christopher Gadsden, Managing Director, Watson-Marlow Limited, Falmouth, Cornwall TR11 4RU, England. Telephone +44 (0) 1326 370370 Fax +44 (0) 1326 376009.

The information in this user guide is believed to be correct at the time of publication. However, Watson-Marlow Limited accepts no liability for errors or omissions. Watson-Marlow Bredel has a policy of continuous product improvement, and reserves the right to alter specifications without notice. This manual is intended for use only with the pump it was issued with. Earlier or later models may differ. The most up-to-date manuals appear on the Watson-Marlow website: http://www.watson-marlow.com

3 Five-year warranty

520 cased pumps, 620 cased pumps and 720 cased pumps

For any 520, 620 or 720 cased pump purchased after 1 January 2007, Watson-Marlow Limited ("Watson-Marlow") warrants, subject to the conditions and exceptions below, through either Watson-Marlow, its subsidiaries, or its authorised distributors, to repair or replace free of charge, any part of the product which fails within five years of the day of manufacture of the product. Such failure must have occurred because of defect in material or workmanship and not as a result of operation of the product other than in normal operation as defined in this pump manual.
Watson-Marlow shall not be liable for any loss, damage, or expense directly or indirectly related to or arising out of the use of its products, including damage or injury caused to other products, machinery, buildings, or property, and Watson-Marlow shall not be liable for consequential damages, including, without limitation, lost profits, loss of time, inconvenience, loss of product being pumped, and loss of production. This warranty does not obligate Watson-Marlow to bear any costs of removal, installation, transportation, or other charges which may arise in connection with a warranty claim.

Conditions of and specific exceptions to the above warranty are:

**Conditions**
- Products must be returned by pre-arrangement, carriage-paid, to Watson-Marlow, or a Watson-Marlow approved service centre.
- All repairs or modifications must have been made by Watson-Marlow Limited, or a Watson-Marlow approved service centre or with the express permission of Watson-Marlow.
- Warranties purporting to be on behalf of Watson-Marlow made by any person, including representatives of Watson-Marlow, its subsidiaries, or its distributors, which do not accord with the terms of this warranty shall not be binding upon Watson-Marlow unless expressly approved in writing by a Director or Manager of Watson-Marlow.

**Exceptions**
- The warranty shall not apply to repairs or service necessitated by normal wear and tear or for lack of reasonable and proper maintenance.
- All tubing and pumping elements as consumable items are excluded.
- Products which, in the judgment of Watson-Marlow, have been abused, misused, or subjected to malicious or accidental damage or neglect are excluded.
- Electrical surge as a cause of failure is excluded.
- Chemical attack is excluded
- All pumphead rollers are excluded.
- The 620R family of pumpheads are excluded from all warranty when pumping above 2 bar while above 165rpm.
- Pumpheads from the 313/314 and the Microcassette ranges and any 701 extension pumpheads are excluded and retain their one-year standard pumphead warranty. The drive they are attached to is subject to the five-year warranty as set out here.
- Ancillaries such as leak detectors are excluded.
4 When you unpack your pump

Unpack all parts carefully, retaining the packaging until you are sure all components are present and in good order. Check against the components supplied list, below.

Packaging disposal

Dispose of packaging materials safely, and in accordance with regulations in your area. The outer carton is made of corrugated cardboard and can be recycled.

Inspection

Check that all components are present. Inspect components for damage in transit. If anything is missing or damaged, contact your distributor immediately.

Components supplied

620UN, 620U, 620SN and 620S pumps are dedicated to 620R series pumpheads. Pumps are supplied as:

- Dedicated 620R pump drive unit fitted with 620R, 620RE or 620RE4 pumphead (see 8. Pump specifications).
- A 620N module providing pump ingress protection to IP66, NEMA 4X, if a 620UN or 620SN.
  **Note:** the module is attached for transit, but must be removed to allow wiring up, voltage selection and fuse inspection and then re-affixed before the pump is operated.
- The designated mains power lead for your pump
- PC-readable CDROM containing these operating instructions
- Quick Start manual

Note: Some versions of this product will include components different from those listed above. Check against your purchase order.

Storage

This product has an extended shelf life. However, care should be taken after storage to ensure that all parts function correctly. Users should be aware that the pump contains a battery with an unused life of seven years. Long-term storage is not recommended for peristaltic pump tubing. Please observe the storage recommendations and use-by dates which apply to tubing you may wish to bring into service after storage.
5 Information for returning pumps

Equipment which has been contaminated with, or exposed to, body fluids, toxic chemicals or any other substance hazardous to health must be decontaminated before it is returned to Watson-Marlow or its distributor.

A certificate included at the rear of these operating instructions, or signed statement, must be attached to the outside of the shipping carton. This certificate is required even if the pump is unused.

If the pump has been used, the fluids that have been in contact with the pump and the cleaning procedure must be specified along with a statement that the equipment has been decontaminated.

6 Peristaltic pumps - an overview

Peristaltic pumps are the simplest pump, with no valves, seals or glands to clog or corrode. The fluid contacts only the bore of a tube, eliminating the risk of the pump contaminating the fluid, or the fluid contaminating the pump. Peristaltic pumps can run dry.

How they work

A compressible tube is squeezed between a roller and a track on an arc of a circle, creating a seal at the point of contact. As the roller advances along the tube, the seal also advances. After the roller has passed, the tube returns to its original shape, creating a partial vacuum which is filled by fluid drawn from the inlet port.

Before the roller reaches the end of the track, a second roller compresses the tube at the start of the track, isolating a packet of fluid between the compression points. As the first roller leaves the track, the second continues to advance, expelling the packet of fluid through the pump’s discharge port. At the same time, a new partial vacuum is created behind the second roller into which more fluid is drawn from the inlet port.

Backflow and siphoning do not occur, and the pump effectively seals the tube when it is inactive. No valves are needed.

The principle may be demonstrated by squeezing a soft tube between thumb and finger and sliding it along: fluid is expelled from one end of the tube while more is drawn in at the other.

Animal digestive tracts function in a similar way.

Suitable applications

Peristaltic pumping is ideal for most fluids, including viscous, shear-sensitive, corrosive and abrasive fluids, and those containing suspended solids. They are especially useful for pumping operations where hygiene is important.

Peristaltic pumps operate on the positive displacement principle. They are particularly suitable for metering, dosing and dispensing applications. Pumps are easy to install, simple to operate and inexpensive to maintain.
7 Safety notes

In the interests of safety, this pump and the tubing selected should only be used by competent, suitably trained personnel after they have read and understood this manual, and considered any hazard involved. If the pump is used in a manner not specified by Watson-Marlow Ltd, the protection provided by the pump may be impaired.

This symbol, used on the pump and in this manual, means: Caution, refer to accompanying documents.

This symbol, used on the pump and in this manual, means: Do not allow fingers to contact moving parts.

This symbol, used on the pump and in this manual, means: Recycle this product under the terms of the EU Waste Electrical and Electronic Equipment (WEEE) Directive.

There is a user-replaceable type T5A H 250V fuse in the fuseholder in the centre of the switchplate at the back of the pump. The 620N module must be removed, if a 620DiN, to allow access to the switchplate. See 20.1 620N module removal and replacement. There are thermal fuses within the pump which self-reset within 60 seconds; if they trip an error code is displayed. This pump contains no user-serviceable fuses or parts.

Fundamental work with regard to lifting, transportation, installation, starting-up, maintenance and repair should be performed by qualified personnel only. The unit must be isolated from mains power while work is being carried out.
Any person who is involved in the installation or periodic maintenance of this equipment should be suitably skilled or instructed and supervised using a safe system of work. In the UK this person should also be familiar with the Health and Safety at Work Act 1974.

**There are moving parts inside the pumphead. Before opening the tool-unlockable pumphead guard, ensure that the following safety directions are followed.**

- Ensure that the pump is isolated from the mains power.
- Ensure that there is no pressure in the pipeline.
- If a tube failure has occurred, ensure that any fluid in the pumphead has been allowed to drain to a suitable vessel, container or drain.
- Ensure that protective clothing and eye protection are worn if hazardous fluids are pumped.
- Primary operator protection from rotating parts of the pump is provided by the pumphead safeguard. Note that safeguards differ, depending on the type of pumphead. See the pumphead section of this manual: 26.
- Secondary operator protection from rotating parts of the pump is provided by electrical interlocking of the pumphead guard. This function will stop the pump if the guard is inadvertently opened while the pump is running. For details of permissible pumphead orientations, see the pumphead section of this manual: 26.

---

This product does not comply with the ATEX directive and must not be used in explosive atmospheres.

This pump must be used only for its intended purpose. The pump must be accessible at all times to facilitate operation and maintenance. Access points must not be obstructed or blocked. The pump’s mains plug is the disconnecting device (for isolating the motor drive from the mains supply in an emergency). Do not position the pump so that it is difficult to disconnect the mains plug. Do not fit any devices to the drive unit other than those tested and approved by Watson-Marlow. Doing so could lead to injury to persons or damage to property for which no liability can be accepted.

If hazardous fluids are to be pumped, safety procedures specific to the particular fluid and application must be put in place to protect against injury to persons.

The exterior surfaces of the pump may get hot during operation. Do not take hold of the pump while it is running. Let it cool after use before handling it.

No attempt should me made to run the drive without a pumphead fitted.

The pump weighs more than 18kg (the exact weight depends on model and pumphead—see 8 *Pump specifications*). Lifting should be performed according to standard Health and Safety guidelines. Finger recesses are built into the sides of the lower shell for convenience in lifting; in addition, the pump can conveniently be lifted by grasping the pumphead and (where fitted) the 620N module at the rear of the pump.
8 Pump specifications

Labels fixed to the rear of the pump contain manufacturer and contact details, product reference number, serial number and model details.

The same information is carried on the drive’s backplate, accessible when the 620N module is removed. The picture below is how a 620SN looks from the box. The number of connectors varies according to the model.
620UN, IP66 NEMA 4X model, and 620U, IP31 model

This pump can be controlled from the keypad or remotely. It features:

**Manual control**
- Speed adjustment; run and stop; direction control; "max" key for rapid priming.

**Remote control**
- The pump can be digitally controlled with a contact closure or logic input signal to operate the pump.

**Analogue control**
- The pump speed can be controlled through an analogue signal input in the ranges 0-10V, 1-5V or 4-20mA.

**Outputs**
- A 0-10V, 4-20mA or 0-1258Hz output signal provides feedback of the pump speed. There are four digital (620U) or relay (620UN) status outputs which can be configured in software for a variety of pump parameters.

**MemoDose**
- Allows precise repeat dosing. Stores in memory a pulse count from the motor. This count is repeated each time START is pressed to provide a single-shot dose.

**Calibration**
- Uses the same pulse count as MemoDose. The corresponding pumped volume can be entered to calibrate the flow of the pump.

**Guard switch**
- Primary operator protection from rotating parts of the pump is provided by the fixed guard. Secondary operator protection from rotating parts of the pump is provided by indicator-only switching of the pumphead guard.

620SN, IP66 NEMA 4X model, and 620S, IP31 model

This pump operates by manual control only. There are no external control connections. All pump functions are controlled from the keypad. It features:

**Manual control**
- Speed adjustment; run and stop; direction control; "max" key for rapid priming.

**MemoDose**
- Allows precise repeat dosing. Stores in memory a pulse count from the motor. This count is repeated each time START is pressed to provide a single-shot dose.

**Calibration**
- Uses the same pulse count as MemoDose. The corresponding pumped volume can be entered to calibrate the flow of the pump.

**Guard switch**
- Primary operator protection from rotating parts of the pump is provided by the fixed guard. Secondary operator protection from rotating parts of the pump is provided by indicator-only switching of the pumphead guard.

### Enclosure rating - 620UN, 620SN
IP66 to BS EN 60529; Equivalent to NEMA 4X to NEMA 250* (indoor use). Suitable for heavy industrial, process and filthy environments. The drive uses a Gore membrane vent to equalise the pressure inside the enclosure and to prevent ingress of water and corrosive vapours.

### Enclosure rating - 620U, 620S
IP31 to BS EN 60529. Equivalent to NEMA 2, suitable for indoor use. Protected against dripping water and falling dirt. May be wiped with a damp cloth, but should not be immersed.

### Pumphead options
620R, 620RE, 620RE4

### Operating temperature range
5C to 40C, 41F to 104F

### Storage temperature range
-25C to 65C, -13F to 149F

### Maximum altitude
2,000m, 6,560ft

### Humidity (non-condensing) (620U, 620S)
80% up to 31C, 88F, decreasing linearly to 50% at 40C, 104F

### Humidity (condensing) (620UN, 620SN)
10% - 100% RH

### Weight
See table on previous page

### Noise
<70dB(A) at 1m

* Protect from prolonged UV exposure.

8.1 Pressure capability

0-4 bar higher pressure pumping

This pump’s default running speed is 165rpm. It can be run at any speed up to 265rpm. Please note, however:

- The 620RE and 620RE4 rotor warranty is limited to 2 bar from 165rpm to 265rpm.
- A warning is displayed when the user sets the speed above 165rpm.
  
  Note: Applies to 620RE MarkII and 620RE4 MarkII pumpheads only.
- The pump’s software records the duration of operation above 165rpm.

9 Good pump installation practice

9.1 General recommendations

Position

A correctly engineered installation will promote long tube life. Site the pump on a flat, horizontal, rigid surface, free from excessive vibration, to ensure correct lubrication of the gearbox. Allow a flow of air around the pump to ensure that heat can be dissipated. Ensure that the temperature around the pump does not exceed 40°C.

Do not stack other 620 pumps on top of this pump. It is, however, acceptable to stack other equipment on the upper surface of the 620 (as long as the ambient temperature does not exceed 40°C).

Emergency disconnection

The pump’s mains plug is the disconnecting device (for isolating the motor drive from the mains supply in an emergency). Do not position the pump so that it is difficult to disconnect the mains plug. The STOP key on the keypad will always stop the pump. However, it is recommended that a suitable local emergency stop device is fitted into the mains supply to the pump.

Valves

Peristaltic pumps are self-priming and self-sealing against backflow. No valves are required in inlet or discharge lines. Valves in the process flow must be opened before the pump operates. Users are advised to fit a pressure relief device between the pump and any valve on the discharge side of the pump to protect against damage caused by accidental operation with the discharge valve closed.

The pump may be set up so that the direction of rotor rotation is clockwise or counterclockwise, whichever is convenient.

Tubing materials: run-in advice

Sta-Pure, Chem-Sure and Marprene TM tubing are hard to compress when new. When using tubing made of these materials, the first five pumphead revolutions should be at a speed of 10rpm or greater. If the pump is run slower, the safety system built into pump drive’s software may cause it to stop and display an overcurrent error message.

Pressure advice

In most circumstances, rotor and tube life are maximised if the pumphead is run slowly, particularly when pumping at high pressure. However, to maintain performance at pressures above 2 bar, avoid running the pumphead below 50rpm. If low-flow, high-pressure operation is necessary, switching to a smaller tube is recommended.
9.2 Do’s and do not’s

Do not build a pump into a tight location without adequate airflow around the pump.

Do ensure that when the 620N watertight module is fitted the seals are intact and properly located. Ensure that the holes for cable glands are properly sealed to maintain the IP66 / NEMA 4X rating.

Do not strap the control and mains power cables together.

Do keep delivery and suction tubes as short and direct as possible - though ideally not shorter than 1m - and follow the straightest route. Use bends of large radius: at least four times the tubing diameter. Ensure that connecting pipework and fittings are suitably rated to handle the predicted pipeline pressure. Avoid pipe reducers and lengths of smaller bore tubing than the pumphead section, particularly in pipelines on the suction side. Any valves in the pipeline (not usually needed) must not restrict the flow. Any valves in the flow line must be open when the pump is running.

Do use suction and delivery pipes equal to or larger than the bore of the tube in the pumphead. When pumping viscous fluids use pipe runs with a bore several times larger than the pump tube.

Do ensure that on longer tube runs at least 1m of smooth bore flexible tubing is connected to the inlet and discharge port of the pumphead to help to minimize impulse losses and pulsation in the pipeline. This is especially important with viscous fluids and when connecting to rigid pipework.

Do site the pump at or just below the level of the fluid to be pumped if possible. This will ensure flooded suction and maximum pumping efficiency.

Do keep the pumphead track and all moving parts clean and free from contamination and debris.

Do run at slow speed when pumping viscous fluids (though see Pressure advice in 9.1 General recommendations). Flooded suction will enhance pumping performance in all cases, particularly for materials of a viscous nature.

Do recalibrate after changing pump tubes, fluid, or any connecting pipework. It is also recommended that the pump is recalibrated periodically to maintain accuracy.

IP66 / NEMA 4X models may be hosed down, but should not be immersed. Protect from prolonged UV exposure.

IP31 models may be wiped with a damp cloth, but should not be hosed or immersed. The front of IP31 models is further protected against light spillages onto the pump.

When using Marprene or Bioprene continuous tubing, do re-tension the tube after the first 30 minutes of running.

Tube selection: The chemical compatibility lists published in Watson-Marlow publications are guides. If in doubt about the compatibility of a tube material and the duty fluid, request a Watson-Marlow tube sample card for immersion trials.
10 Connecting this product to a power supply

A well regulated electrical mains supply is required along with cable connections conforming to the best practice of noise immunity. It is not recommended to site these drives alongside “dirty” electrical mains supplies such as 3-phase contactors and inductive heaters without special attention being paid to unacceptable mains-borne noise.

The voltage selector is mounted in the switchplate at the rear of the pump, protected from water by the 620N module (620DuN). The module must be removed to allow access to the switchplate. See 20.1 620N module removal and replacement. Set the voltage selector to 115V for 100-120V 50/60Hz supplies or 230V for 200-240V 50/60Hz supplies. Always check the voltage selector switch before connecting the mains supply. Make suitable connection to an earthed, single-phase mains electricity supply.

We recommend using commercially available supply voltage surge suppression where there is excessive electrical noise.

**Power cable:** The pump is supplied fitted with either of two cable glands and approximately 2.8m of power cable. The European cable is to Harmonised code H05RN-F3G0.75, used with our gland part number SL0128 which is suitable for an outside cable sheath diameter of 4-7mm. The north American cable is to type SJTOW 105C 3-18AWG VW-1 used with our gland part number SL0123 which is suitable for an outside cable sheath diameter of 7-9mm.

Power cables of NEMA 4X specification pumps are fitted with a standard US mains power plug. IP66 specification pumps are supplied with no plug. Wiring a mains plug must only be undertaken by suitably skilled, qualified personnel.

**Conductor coding**

</tbody>
</table>
The voltage selector switch is not visible while the 620N module is in place. Do not switch the pump on unless you have checked that it is set to suit your power supply by removing the module and inspecting the switch, and then refitting the module. See 20.1 620N module removal and replacement.

If the mains power cable is inappropriate for your installation, it can be changed. Please contact your local Watson-Marlow Bredel service centre.

Input line fusing: type T5A H 250V 20mm time-delayed cartridge fuse, located in a fuseholder in the centre of the switchplate at the rear of the pump.

Power interruption: This pump has an auto-restart feature which, when active, will restore the pump to the operating state it was in when power was lost. See 16.6 Auto-restart.

Stop / start power cycles: Do not power up/power down for more than 100 starts per hour, whether manually or by means of the auto-restart facility. We recommend remote control where a high number of starts is required.

11 Start-up check list

Note: See also 26.6 and 26.7 Tube loading.

- Ensure that proper connections are achieved between the pump tube and suction and discharge piping.
- Ensure proper connection has been made to a suitable power supply.
- Ensure that the recommendations in section 9. Good pump installation practice are followed.
12 Switching the pump on for the first time

Note: This manual uses **bold** type to highlight the active option in menu screens: "**English**" in the first screen represented here. The active option appears on the pump display in *inverse* text.

- Switch on the power supply at the rear of the pump. The pump runs a power-on test to confirm proper functioning of the memory and hardware. If a fault is found, an error message is displayed. See 23.1 Error codes.
- The pump displays a language menu. Use the **UP** and **DOWN** keys to select your language. Press the **ENTER** key to confirm your choice.
- **The information which follows assumes that your choice was English.**
- When the language is chosen this menu will not appear again and all menus will appear in the language you chose. (Language can be reset as described later. See 16.13 Language.)
- The pump displays the Watson-Marlow start-up screen for four seconds, followed by the pump model identity screen for four seconds (an example is shown here), and then the manual mode main screen.
- The rotation symbol on the display indicates clockwise rotation. The default speed setting is 165rpm, but 265rpm is available (see 16.7 Set maximum allowed speed). Other initial start-up operational parameters are listed in the table below.

The pump is now ready to operate according to the defaults listed above.

All operating parameters may be changed by means of key-presses. See 14. Manual operation.
13 Switching the pump on in subsequent power cycles (if not in auto-restart mode)

- Switch on the power supply at the rear of the pump. The pump runs a power-on test to confirm proper functioning of the memory and hardware. If a fault is found, an error message is displayed. See 23.1 Error codes.
- The pump displays the Watson-Marlow start-up screen for four seconds followed by the pump model identity screen for four seconds (an example is shown here), and then the manual mode main screen.
- **Note:** Once in the manual mode main screen, keys assume their normal functions - see 15.1 Keypad in menu screens below. A subsequent press on START causes the pump to operate.
- Start-up defaults are those in place when the pump was switched off last. Check that the pump is set to operate as you require it.

**The pump is now ready to operate.**

All operating parameters may be changed by means of key-presses. See 14. Manual operation below.
14 Manual operation

14.1 Keypad functions, 620UN, 620U

All settings and functions of the pump in manual mode are set and controlled by means of key-presses. Immediately after the start-up display sequence detailed above, the manual mode main screen will be displayed. The currently selected rotation direction is indicated on the display by a clockwise or counter-clockwise segmented arrow. If an exclamation mark (!) shows, it indicates that Auto-restart is on. If a padlock icon (🔒) shows, it indicates that Keypad lock is on.

Note: A number of the controls listed below are shortcuts to commands which are also available through the Main menu. See 15 Main menu.

A brief single press on each key triggers a beep sound (if enabled - see 14.6 Keypad beep) and causes the pump to function as follows:

- **START**: starts the pump at the speed and in the direction shown on the display. The rotation symbol will become animated to confirm that the pump is operating.

If the pump is running when **START** is pressed, it causes the information shown on the manual mode main screen to cycle from revolutions per minute, to flowrate in a choice of units (via a warning screen if flowrate has not been calibrated and if this is the first cycle since power-up) to rpm, flowrate and Run time. An example is shown here. The default can be altered from within the Setup menu (see 16.3 Display).
- **MAX**: while pressed, MAX operates the pump at the maximum allowed speed and in the direction shown on the display. When released, the pump returns to its previous status.

  **Note**: Priming can be achieved by pressing the MAX key until fluid flows through the pump and reaches the point of discharge, and then releasing the MAX key.

- **AUTO/MAN**: toggles the pump into analogue control. When started, the pump runs at the speed set by any analogue signal applied to the pump, and in the direction shown in the display.

- **STOP**: if the pump is running, pressing STOP stops the pump. The display will continue to show the previous speed and direction. The pump will return to this speed and direction when the START key is pressed again.

- **UP**: increases the speed shown on the display in minimum steps of 0.1rpm, or other steps as pre-selected in the Scrolling section of the Setup menu. If the pump is then started by pressing the START key, it will operate at the new speed. If the pump is running when UP in pressed, the change takes effect immediately.

  **Note**: If the pump's flow rate has been calibrated (see 17.3 *Calibration*), after a speed change a screen showing the new rpm figure and the new flowrate is displayed for four seconds before returning the user to the previously set manual mode main screen: rpm or flowrate.

- **DOWN**: decreases the speed shown on the display in minimum steps of 0.1rpm, or other steps as pre-selected in the Scrolling section of the Setup menu. If the pump is then started by pressing the START key, it operates at the new speed. The minimum speed possible is 0.1rpm. If the pump is running when DOWN is pressed, the change takes effect immediately.

  **Note**: You can reduce the pump speed from 0.1rpm (or any other minimum displayed unit of speed as selected in the Scrolling section of the Setup menu) to 0rpm by a further press on the DOWN key. The pump is still in the running state and the rotation symbol will continue to move. Press the UP key to return the pump to the minimum speed.

  **Note**: If a minimum allowed speed has been set in the Set Min Speed section of the Setup menu, the above note on speed reduction to 0rpm does not apply.

- **DIRECTION**: toggles the direction of rotation shown on the display. If the pump is then started by pressing the START key, it rotates in the new direction. If the pump is running when DIRECTION is pressed, the change takes effect immediately.

- **ENTER**: is used to enter/confirm numeric and menu selections. Also cycles the information shown on the manual mode main screen exactly as START does, whether the pump is running or not. See START, above.

- **MENU**: causes the main menu to be displayed, from which all aspects of pump setup can be controlled, including the MemoDose facility. See 15. *Main menu.*
Keypress combinations cause the pump to function as follows:

Note: A number of the controls listed below are shortcuts to commands which are also available through the Main menu. See 15. Main menu.

- **UP** and **DIRECTION** on power-up: toggles the keypad beep on and off.
- **START** on power-up: switches on the Auto-restart facility. See 16.6 Auto-restart.
- **STOP** on power-up: switches off the Auto-restart facility. See 16.6 Auto-restart.
- **STOP** and **DIRECTION** on power-up: allows the user to press **UP** and **DOWN** keys to toggle the sense of remote run/stop control between open=stop and open=run.
- **STOP** and **UP** while the pump is stopped: turns the display backlight on.
- **STOP** and **DOWN** while the pump is stopped: turns the display backlight off.
- **MAX** and **UP**: sets the pump to maximum allowed speed.
- **MAX** and **DOWN**: sets the pump to minimum allowed speed.
- **DIRECTION** and **DOWN**: interrupts the display to show the pump’s ROM version for four seconds.
- **START** pressed and held for two seconds: toggles the keypad lock on and off. Only the **START** and **STOP** keys are active when keypad lock is on. The padlock icon is displayed.
- **STOP** pressed and held for two seconds: toggles the keypad lock on and off. Only the **START** and **STOP** keys are active when keypad lock is on. The padlock icon is displayed.
- **STOP STOP** within half a second: shortcut entry to the MemoDose menu; when in MemoDose, shortcut return to manual mode main screen. See 17. MemoDose.

### 14.2 Keypad functions, 620SN, 620S

All settings and functions of the pump in manual mode are set and controlled by means of key-presses. Immediately after the start-up display sequence detailed above, the manual mode main screen will be displayed. The currently selected rotation direction is indicated on the display by a clockwise or counter-clockwise segmented arrow. If an exclamation mark (!) shows, it indicates that Auto-restart is on. If a padlock icon (🔒) shows, it indicates that Keypad lock is on.

A brief single press on each key triggers a beep sound (if enabled - see 14.6 Keypad beep) and causes the pump to function as follows:
- **START**: starts the pump at the speed and in the direction shown on the display. The rotation symbol will become animated to confirm that the pump is operating.

![Image](image)

If the pump is running when **START** is pressed, it causes the information shown on the manual mode main screen to cycle from revolutions per minute, to flowrate in millilitres per minute (via a warning screen if flowrate has not been calibrated and if this is the first cycle since power-up) to rpm and flowrate. An example is shown here.

- **MAX**: while pressed, **MAX** operates the pump at the maximum allowed speed and in the direction shown on the display. When released, the pump returns to its previous status.
  
  **Note**: Priming can be achieved by pressing the **MAX** key until fluid flows through the pump and reaches the point of discharge, and then releasing the **MAX** key.

- **STOP**: if the pump is running, pressing **STOP** stops the pump. The display will continue to show the previous speed and direction. The pump will return to this speed and direction when the **START** key is pressed again.
  
  **STOP** is also used in the MemoDose facility, while calibrating the pump, and setting the maximum speed.

- **UP**: increases the speed shown on the display in minimum steps of 0.1rpm, or other steps as pre-selected in the Scrolling section of the Setup menu, (unless the speed displayed is already the maximum allowed speed). If the pump is then started by pressing the **START** key, it will operate at the new speed. If the pump is running when **UP** in pressed, the change takes effect immediately.
  
  **Note**: If the pump’s flow rate has been calibrated (see 17.3 Calibration), after a speed change a screen showing the new rpm figure and the new flowrate is displayed for four seconds before returning the user to the previously set manual mode main screen: rpm or flowrate.

- **DOWN**: decreases the speed shown on the display in minimum steps of 0.1rpm, or other steps as pre-selected in the Scrolling section of the Setup menu. If the pump is then started by pressing the **START** key, it operates at the new speed. The minimum speed possible is 0.1rpm. If the pump is running when **DOWN** is pressed, the change takes effect immediately.
  
  **Note**: If the pump’s flow rate has been calibrated (see 17.3 Calibration), after a speed change a screen showing the new rpm figure and the new flowrate is displayed for four seconds before returning the user to the previously set manual mode main screen: rpm or flowrate.

  **Note**: You can reduce the pump speed from 0.1rpm (or any other minimum displayed unit of speed as selected in the Scrolling section of the Setup menu) to 0rpm by a further press on the **DOWN** key. The pump is still in the running state and the rotation symbol will continue to move. Press the **UP** key to return the pump to the minimum speed.

  **Note**: If a minimum allowed speed has been set in the Set Min Speed section of the Setup menu, the above note on speed reduction to 0rpm does not apply.
- **DIRECTION**: toggles the direction of rotation shown on the display. If the pump is then started by pressing the **START** key, it rotates in the new direction. If the pump is running when **DIRECTION** is pressed, the change takes effect immediately.
- **ENTER**: is used to enter/confirm numeric and menu selections. Also cycles the information shown on the manual mode main screen exactly as **START** does, whether the pump is running or not. See **START**, above.
- **MENU**: causes the main menu to be displayed, from which pump Setup and MemoDose can be controlled. See 15. **Main menu**.
- **MEMODOSE**: causes the MemoDose facility to be displayed. See 17. **MemoDose**.

**Keypress combinations** cause the pump to function as follows:

- **DIRECTION** on power-up: resets **defaults**.
- **UP** and **DIRECTION** on power-up: toggles the **keypad beep** on and off.
- **START** on power-up: switches on the **Auto-restart** facility. See 16.6 **Auto-restart**.
- **STOP** on power-up: switches off the **Auto-restart** facility. See 16.6 **Auto-restart**.
- **STOP** and **UP** while the pump is stopped: turns the **display backlight** on.
- **STOP** and **DOWN** while the pump is stopped: turns the **display backlight** off.
- **DIRECTION** and **DOWN**: interrupts the display to show the pump’s ROM version for four seconds.
- **MAX** and **UP**: sets the pump to maximum allowed speed.
- **MAX** and **DOWN**: sets the pump to minimum allowed speed.
- **START** pressed and held for two seconds: toggles the **keypad lock** on and off. Only the **START** and **STOP** keys are active when keypad lock is on. The pad-lock icon is displayed.
- **STOP** pressed and held for two seconds: toggles the **keypad lock** on and off. Only the **START** and **STOP** keys are active when keypad lock is on. The pad-lock icon is displayed.
- **STOP STOP** within half a second: shortcut entry to the MemoDose menu; when in MemoDose, shortcut return to manual mode main screen. See 17. **MemoDose**.
14.3 Speed

To change the running speed:

- Use the **UP** and **DOWN** keys to change the pump’s running speed within limits of the minimum allowed speed and the maximum allowed speed. The minimum speed possible is 0.1rpm.

  **Note:** You can reduce the pump speed from 0.1 rpm to 0 rpm by a further press on the **DOWN** key. The pump is still in the running state and the rotation symbol will continue to move. Press the **UP** key to return the pump to the minimum speed.

**Note:** The maximum allowed speed of the drive defaults to 165rpm. It is possible to set this limit at any speed up to 265rpm. See 16.7 Set maximum allowed speed, and section 3 Five-year warranty.

14.4 Direction

To toggle the pump’s rotation sense:

- Press **DIRECTION** to toggle the pump between clockwise and counter-clockwise rotation.

  **Note:** Direction control is available subject to access not being limited by security code. See 16.15 Security code.

14.5 Keypad lock

The keypad can be locked to prevent changes to pump speed or other settings, and make it possible only to start or stop the pump. The padlock symbol shows on the display.

- While the pump is running, hold down the **START** key for two seconds. The padlock symbol shows and only the **START** and **STOP** keys function.

- The keypad may also be locked while the pump is stopped. Hold down the **STOP** key for two seconds. The padlock symbol shows and only the **START** and **STOP** keys function.

- To unlock the keypad while the pump is running hold down the **START** key for two seconds. The padlock symbol is removed. If the pump is stopped hold down the **STOP** key until the padlock symbol is removed.

  **Note:** Keypad lock is available subject to access not being limited by security code. See 16.15 Security code.

14.6 Keypad beep

The pump keypad can operate silently or indicate a positive key-press with a beep sound.

- To toggle the sound on and off, stop the pump. Turn off the mains power switch at the rear of the pump.

- Depress the **UP** and **DIRECTION** keys while switching on the mains power switch at the rear of the pump.
14.7 To reset defaults

All settings can be re-set to factory defaults.
- Turn off the mains power switch at the rear of the pump.
- Press the DIRECTION key while switching on the mains power switch at the rear of the pump. A warning screen is displayed briefly, followed by a screen asking the user to confirm that factory defaults are to be reset.
- Select Yes or No using the UP and DOWN keys. Confirm by pressing ENTER. If Yes was confirmed, the pump resets all user-settable data to default values and displays the manual mode main screen. If No was confirmed, no change is made and the manual mode main screen is displayed.

The language of display screens may be reset only by resetting defaults.

14.8 To reset language

The language of display screens is set on initial start-up. To reset language, reset all defaults (see 14.7 To reset defaults).

14.9 Backlight

To turn the display backlight on:
- Depress the STOP and UP keys together.

To turn the display backlight off:
- Depress the STOP and DOWN keys together.

See 16.11 Backlight.

14.10 Auto-restart

This pump offers an auto-restart feature. When active on power loss, it will restore the pump when power returns to the operating state it was in when power was lost. It does not operate when powering down in the middle of a dose; when the pump is restarted, it will await a press on the START key to begin the interrupted dose again. Auto-restart is retained while the pump is switched off. When the pump starts running look for the ! symbol on the display. This ! symbol indicates that the pump is set for auto-restart.

Do not use auto-restart for more than 100 starts per hour. We recommend remote control where a high number of starts is required.
To turn the auto-restart facility on:

- Turn off the mains power switch at the rear of the pump.
- Depress the **START** key while switching on the mains power switch at the rear of the pump.

To turn the auto-restart facility off:

- Turn off the mains power switch at the rear of the pump.
- Depress the **STOP** key while switching on the mains power switch at the rear of the pump.

### 14.11 Manual operation and remote digital inputs and outputs

The remote run / stop, direction and leak-detected inputs are operational.

The remote status outputs are all fully functional.

The **STOP** key acts as an overriding emergency stop. The run / stop input will not start the pump in manual mode, but once the **START** key has been pressed, the remote run / stop input will stop and start the pump according to its operational state.

**UN, U** If you invert the operation of the remote run / stop switch to operate as open=stop, you must connect pin 7 to 19, lower D-connector, to be able to start the pump from the keypad. See 20.6 *Run/stop input*.

**U** If you invert the operation of the remote run / stop switch to operate as open=stop, you must connect pin 7 to 19, lower D-connector, to be able to start the pump from the keypad. See 20.6 *Run/stop input*.

If **STOP** is pressed the remote run / stop switch will have no effect.

You cannot invert the remote direction signal.
15 Main menu

15.1 Keypad functions in menu screens

In addition to their functions in other operations, the following keys have specific actions in menu screens:

- **STOP**: In general, STOP functions as a "go back" key, taking the user up one menu level without making a change.
- **UP**: The UP key is used in menu item selection: it moves a highlight up the menu. When a numerical entry screen is displayed, pressing UP increases the number displayed.
- **DOWN**: The DOWN key is used in menu item selection: it moves a highlight down a menu. When a numerical entry screen is displayed, pressing DOWN decreases the number displayed.
- **ENTER**: The ENTER key functions in a similar way to the "enter" key of a personal computer: it confirms key-presses made immediately before. In menu item selection, it triggers the action or display selected from a menu using the UP and DOWN keys.

**Note**: Confirmation screens are displayed for 4 seconds. While they are displayed, a single press on any key removes them.

15.2 Main menu entry

The MENU key displays the main menu and stops the pump if it is running in manual mode. It operates at any point in the pump’s activity except where error screens are displayed, or where UP and DOWN keys are used to enter values.

The main menu offers four options: **Setup, MemoDose, Pin out details**, and **Exit**. Use the UP and DOWN keys to make a choice. Press the ENTER key to confirm your decision.
**Setup**

**Setup** allows the user to set the pump's operating parameters under 16 headings: Trim, Analogue, Display, Outputs, Remote stop, Auto-restart, Set max speed, Set min speed, Scrolling, Date/time, Backlight, ROM, Language, Defaults, Beep, Security code and Exit.

**MemoDose**

The **MemoDose** facility is used to remember the number of revolutions needed to dispense a previously dispensed volume of fluid, and cause the pump to dispense that volume repeatedly. DOWN keys to make a choice. Press the ENTER key to confirm your decision.

**Pin out details**

Selecting **Pin out details** causes the pump to display an information screen and then its preset pin and voltage details under 18 headings: Analogue input, Analogue output, Tacho output, Run/Stop input, Direction enable input, Direction input, Leak input, Auto/Man toggle input, Dose input, Output 1, Output 2, Output 3, Output 4, Supply voltages, 0 volts availability, Functional earth, Others and Exit.

Pin out information is not relevant to the 620UN IP66/NEMA 4X pumps. Selecting **Pin out details** causes the pump to display a warning screen and redisplay the main menu.

**Exit**

If **Exit** is selected, the pump returns to its last manual state with the pump stopped.

The main menu offers three options: **Setup**, **MemoDose** and **Exit**. Use the UP and DOWN keys to make a choice. Press the ENTER key to confirm your decision.

**Setup**

**Setup** allows the user to set the pump's operating parameters under 7 headings: Set max speed, Set min speed, Scrolling, Date/time, ROM, Defaults and Exit.

**MemoDose**

The **MemoDose** facility is used to remember the number of revolutions needed to dispense a previously dispensed volume of fluid, and cause the pump to dispense that volume repeatedly.

**Exit**

If **Exit** is selected, the pump returns to its last manual state with the pump stopped.
16 Setup

Entry to the Setup menu is from the Main menu and can be limited to users who correctly enter a three-digit security code. If a security code has been set, selecting Setup and confirming with the ENTER key causes the pump to display the Security code entry sequence. See 16.15 Security code. If no security code has been set, the pump displays the first of seven screens containing the Setup menu.

The Setup menu

The Setup menu occupies five screens (620UN, 620U) or two screens (620SN, 620S). The first two of the 620UN and 620U are shown here.

To move from one screen to subsequent screens, repeatedly press DOWN. Each item is highlighted in turn until the last item on the screen is highlighted.

A further press on the DOWN key displays the next screen of the menu, with the first item highlighted.

Follow the reverse procedure using the UP key to move to an item on a previous screen of the menu.

Make a selection using the UP or DOWN keys and press ENTER to confirm your choice.
16.1 Trim

When the pump is under remote control, it tracks an analogue signal from the user’s remote control system to the I/p terminal of the Analogue 1 connectors at the rear of the pump within the ranges 4-20mA, 0-10V or 1-5V. The Trim setup sequence allows the user to customise the process-signal-to-pump-speed calibration. The sequence may be entered directly from the Setup menu or from the Analogue setup menu.

When the pump is under remote control, it tracks an analogue signal from the user’s remote control system to pin 4 of the lower D-connector at the rear of the pump within the ranges 4-20mA, 0-10V or 1-5V. The Trim setup sequence allows the user to customise the process-signal-to-pump-speed calibration. The sequence may be entered directly from the Setup menu or from the Analogue setup menu.
Select Trim from the Setup menu or the Analogue setup menu using the UP or DOWN keys and press ENTER to confirm your choice.

Apply the low process analogue signal to (620UN) the i/p terminal of the Analogue 1 connector or (620U) pin 4 of the lower D-connector as instructed in the display. See 16.2 Analogue. While the signal is being applied, press ENTER to record the signal as a calibration point.

Apply the maximum process control signal. While the signal is being applied, press ENTER to record the signal as a calibration point.

Apply 50% of the maximum process control signal. While the signal is being applied, press ENTER to record the signal as a calibration point.

If a mistake is made, press STOP at any point in the sequence, and the pump displays the previous screen.

The final press on ENTER causes the pump to display a confirmation screen and then redisplay the screen from which it entered the trim sequence: the Setup menu or the Analogue setup menu.

The pump calculates a linear response from low to mid and from mid to high, and records the results as a new analogue input calibration graph.

If any of the three signals match, a warning screen is displayed before the confirmation screen appears, and the trim is ignored.

**Note:** By applying the maximum process control signal when the minimum is requested and vice versa, inverted responses can be set up.

**Note:** Resetting factory defaults clears the trim calibration values.

### 16.2 Analogue

When the pump is under remote control, it tracks an analogue signal from the user’s remote control system to the i/p terminal of the Analogue 1 connector at the rear of the pump within the ranges 4-20mA, 0-10V or 1-5V. The Analogue option in the Setup menu allows the user to configure the pump to operate with his remote control system.

When the pump is under remote control, it tracks an analogue signal from the user’s remote control system to pin 4 of the lower D-connector at the rear of the pump within the ranges 4-20mA, 0-10V or 1-5V. The Analogue option in the Setup menu allows the user to configure the pump to operate with his remote control system.

Select Analogue from the Setup menu using the UP or DOWN keys and press ENTER to confirm your choice.

Three options are displayed: Input, Trim and Menu.
**Input** allows the user to tell the pump which signal type he will apply, or to choose the program option. If he selects **Program** from the subsequent menu, the user can choose his input type and tell the pump the speeds at which to operate on receiving a low or high process control signal. See 16.2.1 Input 1: speed.

**Trim** displays the Trim menu, described above. See 16.1 Trim.

**Menu** returns the user to the first section of the Setup menu. See 16 Setup.

**UN, U**

### 16.2.1 Input 1: speed

- Select **Input** using the **UP** or **DOWN** keys and press **ENTER** to confirm your choice.
- The pump offers three further choices: **4-20mA**, **0-10V** and **1-5V**. Use the **UP** or **DOWN** keys to make a selection and press **ENTER** to confirm your decision.

- The pump configures the hardware and factory-set response data and briefly displays a confirmation screen. The user is returned to the Analogue setup display. Example figures are shown here.
- Alternatively the user can select **Program** to configure the pump to respond in a user-programmed way to any process signal range within within 4-20mA, 0-10V or 1-5V.
Program

- Select Program using the **UP** or **DOWN** keys and press **ENTER** to confirm.
- The pump offers two choices: mA and V (0-10V). Use the **UP** or **DOWN** keys to make a selection and press **ENTER** to confirm your decision.

- The pump displays a screen allowing you to set the speed for low signal input (4mA or 0V). Use the **UP** and **DOWN** keys to scroll the display to your chosen speed and press **ENTER** to confirm the figure.
- The pump displays a screen allowing you to set the speed for high signal input (20mA or 10V). Use the **UP** and **DOWN** keys to scroll the display to your chosen speed and press **ENTER** to confirm the figure.
- If a mistake is made, the user may press **STOP** at any point in the sequence (before pressing **ENTER** on the high signal speed screen), and the pump displays the previous screen.
- The final press on **ENTER** causes the pump to configure the hardware and programmed response data. It briefly displays a confirmation screen and a warning that the analogue signal is not trimmed, and returns the user to the Analogue setup menu. Example values are shown here.
16.2.2 Trim

Trim displays the Trim menu, described above. See 16.1 Trim. It is recommended that a trim calibration is always performed to align the pump’s response to the actual process analogue signal.

16.2.3 Menu

Menu returns the user to the first section of the Setup menu, described above. See 16 Setup.

16.3 Display

The pump can display two default screens in manual mode: revolutions per minute or flowrate.

- In the first screen of the Setup menu select Display using the UP and DOWN keys. Press ENTER to confirm your choice.
- The pump displays a screen allowing you to choose the format of the manual mode main screen. Use the UP and DOWN keys to choose and press ENTER to confirm your decision.
- The pump redisplays the first screen of the Setup menu.
- When the pump next runs, the manual mode main screen will display pump activity in rpm or l/min, according to your choice. Examples are shown here.

Note: A third display option is available: showing rpm and flowrate. See Alternatively, next.

Alternatively ...
- In the manual mode main screen, repeatedly press ENTER to cycle the display between rpm, flowrate or combined, according to your choice. This cycle operates if the pump is running and if it is stopped. While the pump is running, you can cycle the display in the same way by repeatedly pressing START. In both cases, if you have not calibrated the pump since switching it on, a warning screen is displayed for 4 seconds before the flowrate screen appears. The warning does not appear if the display formats are cycled again, unless the pump has been switched off.
- The pump redisplays the first screen of the Setup menu.
16.4 Outputs

The 620UN pump offers four relay status outputs. See 12 Switching the pump on for the first time for initial start-up defaults. Each of six parameters can be configured to any output, or more than one output.

The 620U pump offers four digital status outputs. See 12 Switching the pump on for the first time for initial start-up defaults. Each of six parameters can be configured to any output, or more than one output.

The parameters are:

**Run/stop**
- Provides a status output to indicate whether the pumphead is in a running or stopped condition. When running at 0rpm, the run/stop output indicates running.

**Direction**
- Provides a status output to indicate which direction the pump is set to run in.

**Auto / man**
- Provides a status output to indicate whether the pump is in analogue control mode or manual control mode.

**General alarm**
- Provides an alarm output when any system error condition occurs except: leak detected; analogue signal out of range; analogue over-signal; analogue no signal.

**Leak detected**
- When used with a leak detector, this output provides an alarm when the pump has been automatically switched off following tube failure.

**Head**
- Provides an alarm when the pumphead guard is open. If it is running, the pump will stop.

Outputs 1-4 are available as single-pole change-over relay contacts: Relay 1, 2, 3 and 4. Connect to the normally open or normally closed contacts of the relay as required and configure the pump’s software accordingly. See below in this section.

**Note**: The maximum rating on the relay contacts of this pump is 30VDC; maximum load 30W.

Output 1 and output 2 are available in two formats:
- From pins 10 and 11, lower D-connector, as 5V TTL signals.
- From pins 10 and 11, upper D-connector, as open collector logic outputs.

Output 3 and output 4 provide open collector logic outputs from pins 13 and 12, upper D-connector, respectively.

A supply voltage from the pump (5V, 10V, 12V) or user-supplied up to 30V to pin 22, upper D-connector, provides the voltage level for these logic status outputs.
In the first screen of the Setup menu select Outputs using the UP and DOWN keys. Press ENTER to confirm your choice.

The pump displays a screen allowing you to configure each of the four outputs, or to exit this menu. Use the UP and DOWN keys to choose and press ENTER to confirm your decision.

If Output 1 is chosen, the pump displays the six options.

Selecting General, Leak or Head using the UP and DOWN keys and confirming the choice by pressing ENTER configures that option to Output 1, displays a confirmation screen, and returns the user to the Output selection screen.

Selecting Run/Stop, Direction or Auto/Man using the UP and DOWN keys and confirming the choice by pressing ENTER displays screens allowing the user to configure Run to High or Low, Clockwise to High or Low, and Auto to High or Low respectively. Choose using the UP and DOWN keys and press ENTER to confirm. The option chosen is configured to Output 1. The pump displays a confirmation screen, and returns the user to the Output selection screen.

The user can configure Output 2, Output 3 and Output 4 in the same way, or choose Exit.

If STOP is pressed during configuration, the previous setting for the output is retained and the pump redispays the Output selection screen.

If Exit is chosen, the pump returns the user to the third screen of the Setup menu.
16.5 Remote stop

The 620UN pump can be started and stopped with a remote switch between the 5V terminal and the i/p terminal of the Run/stop input, using an open=run or open=stop command sense. It also operates with a logic input between 5V and 24V on the i/p terminal of the Run/stop input. If remote switching is disabled, neither the remote run/stop nor direction signal inputs will affect the pump state.

The 620U pump can be started and stopped with a remote switch between pin 7 and pin 19 using an open=run or open=stop command sense. It also operates with a logic input between 5V and 24V on pin 7. If remote switching is disabled, neither the remote run/stop nor direction signal inputs will affect the pump state.

In the first screen of the Setup menu select Remote stop using the UP and DOWN keys. Press ENTER to confirm your choice.

The pump displays a screen allowing the user to disable the remote stop feature. Use the UP and DOWN keys to choose Yes or No and press ENTER to confirm the decision.

If No is chosen, the pump asks the user to make a further choice, according to whether the pump is required to run on an open or closed remote switch: Open=stop or Open=run. Choose using the UP and DOWN keys and press ENTER to confirm. The pump briefly displays a confirmation screen and returns the user to the first screen of the Setup menu.

If Yes is chosen, the pump briefly displays a confirmation screen and returns the user to the first screen of the Setup menu. Example screens are shown here.

Note: The confirmation screen indicates whether Remote stop is enabled or disabled, and displays the command sense of the remote control switch even if Remote stop has been disabled. This allows the command sense to be displayed if remote switching is disabled.

Even with the remote stop function disabled, the pump could still start if the remote auto/manual toggle input is used to toggle the pump into analogue mode.
Alternatively ...

- To toggle the sense of the remote run/stop control between open=stop and open=run: stop the pump. Turn off the mains power switch at the rear of the pump.
- Hold down the **STOP** key and the **DIRECTION** key, and turn on the mains power switch.

### 16.6 Auto-restart

This pump offers an auto-restart feature. If active on power loss, it restores the pump when power returns to the operating state it was in when power was lost. It does not operate when powering down in the middle of a dose: when the pump is restarted, it will await a press on the **START** key to begin the interrupted dose again. Auto-restart is retained while the pump is switched off. When the pump starts running, look for the ! symbol on the display. This symbol indicates that the pump is set for auto-restart.

- In the second screen of the Setup menu select **Auto-restart** using the **UP** and **DOWN** keys. Press **ENTER** to confirm your choice.
- The pump displays a screen allowing the user to activate auto-restart. Use the **UP** and **DOWN** keys to choose **On** or **Off** and press **ENTER** to confirm the decision.
- If **Off** is chosen, the pump returns the user to the second screen of the Setup menu. The auto-restart facility will not operate.
- If **On** is chosen, the pump returns the user to the second screen of the Setup menu, where an exclamation mark (!) is now visible. This mark confirms that the auto-restart feature is in place and will operate the next time power is lost and restored.
Alternatively ...

- Stop the pump. Turn off the mains power switch at the rear of the pump.
- Hold down the START key and turn on the mains power switch. The ! symbol shows on the display.
- Start the pump. If the mains supply is interrupted the pump will automatically restart when the mains power returns.
- To remove auto-restart switch off the mains power at the rear of the pump. Hold down the STOP key and turn the mains power switch on. The ! symbol does not appear.

Do not use auto-restart for more than 100 starts per hour. We recommend remote control where a high number of starts is required.

16.7 Set maximum allowed speed

The maximum allowed speed of the drive defaults to 165rpm. It is possible to set this limit at any speed down to 1rpm as long as the minimum allowed speed is at least 1rpm less, or up to 265rpm; however, see 8.1 Pressure capability for use above 165rpm.

- In the second screen of the Setup menu select Set max speed using the UP and DOWN keys. Press ENTER to confirm your choice.
- The pump displays a screen allowing the user to set the maximum speed of the pump equal to or lower than the maximum available. Use the UP and DOWN keys to set the maximum allowed speed and press ENTER to confirm the figure.
- The pump returns the user to the second screen of the Setup menu, via a warning screen requiring the user to press ENTER if he selected a speed greater than 165rpm.

Note: Maximum allowed speed limits speed under manual or analogue control.
16.8 Set minimum allowed speed

The minimum allowed speed of the drive defaults to 0rpm. It is possible to set this limit at any speed up to 264rpm, as long as the maximum speed is at least 1rpm greater.

- In the second screen of the Setup menu select Set min speed using the UP and DOWN keys. Press ENTER to confirm your choice.
- The pump displays a screen allowing the user to set the minimum speed of the pump equal to or higher than the minimum available. Use the UP and DOWN keys to set the minimum allowed speed and press ENTER to confirm the figure.
- The pump returns the user to the second screen of the Setup menu.

Note: Minimum allowed speed limits speed under manual or analogue control.

16.9 Scrolling

In use, the pump’s speed can be set, up to the maximum allowed speed and down to the minimum allowed speed, by pressing the UP and DOWN keys.

In the Scrolling section of the Setup menu, the UP and DOWN keys allow the speed options to be set in increments of the user’s choice: one-tenth of a revolution per minute; one half of a revolution per minute; one, two, five or ten revolutions per minute (or their equivalents in flow rate if the pump has been configured to display its performance in units of flow). Each press on UP, for example, offers a speed one increment greater than the current speed.

Note: For 0.1rpm, 0.5rpm and 1rpm settings, the increments increase progressively as long as the UP or DOWN key is continually held down.
In the third screen of the Setup menu select **Scrolling** using the **UP** and **DOWN** keys. Press ENTER to confirm your choice.

The pump displays a screen allowing the user to set the **UP** and **DOWN** keys’ scrolling increment. Use the **UP** and **DOWN** keys to choose 0.1, 0.5, 1.0, 2.0, 5.0 or 10.0. Press ENTER to confirm your choice.

The pump returns the user to the third screen of the Setup menu.

**Note:** If the maximum allowed speed has been set to a figure which is not a multiple of the chosen increment, the last active press on **UP** raises the speed to that maximum rather than to the next multiple of the chosen increment. Similarly, if the pump is running at a speed which is not a multiple of the chosen increment, the first press on **UP** raises the speed to the next multiple of the chosen increment.

### 16.10 Date and time

The pump’s real-time clock can be set with the date and time.

In the third screen of the Setup menu select **Date/time** using the **UP** and **DOWN** keys. Press ENTER to confirm your choice. The pump displays any previous setting.

If the setting displayed is correct, press ENTER. The pump redisplays the third screen of the Setup menu.

If you wish to change the setting, use the **UP** and **DOWN** keys to enter the current date (two digits), month (three letters), year (four digits), hour, minute and second (all two digits), pressing ENTER to confirm each one.

When ENTER is pressed to confirm the seconds, the pump redisplays the third screen of the Setup menu.
16.11 Backlight

The pump's display can be illuminated or not according to choice.

- In the third screen of the Setup menu select Backlight using the UP and DOWN keys. Press ENTER to confirm your choice.
- The pump displays a screen allowing the user to switch the display backlight on or off. Use the UP and DOWN keys to choose On or Off and press ENTER to confirm the decision.
- The pump returns the user to the third screen of the Setup menu. The display is now illuminated or not according to the user's decision.

Alternatively ...
- To turn the backlight off: press STOP and DOWN together.
- To turn the backlight on: press STOP and UP together.

16.12 ROM

The pump can display its software version, model number and pump speed.

- In the third screen of the Setup menu select ROM using the UP and DOWN keys. Press ENTER to confirm your choice.
- The pump displays the software version, model number and the maximum set pump speed for four seconds (an example is shown here), then returns the user to the third screen of the Setup menu. It also displays a checksum: CHK 123, for example. This may be required if reporting pump performance to the Watson-Marlow service department.

Alternatively ...

Press DIRECTION and DOWN together to interrupt the display and show the pump's ROM version for four seconds.
16.13 Language

The pump can be set to operate in several languages.

- In the fourth screen of the Setup menu select **Language** using the **UP** and **DOWN** keys. Press **ENTER** to confirm your choice.
- In the next screen, choose a language using the **UP** and **DOWN** keys. Press **ENTER** to confirm your choice. The pump redisplay the fourth Setup screen in your chosen language. All screens will subsequently appear in your chosen language.

16.14 Defaults

All the pump’s user-set data can be reset to factory defaults.

- In the fourth screen of the Setup menu select **Defaults** using the **UP** and **DOWN** keys. Press **ENTER** to confirm your choice.
- A warning is displayed for four seconds, and the pump asks the user to confirm that factory defaults are to be reset. Use the **UP** and **DOWN** keys to choose **Yes** if you wish the pump to reset all user-set data back to factory defaults (see 12 Switching the pump on for the first time); or **No** if you do not wish to do this. Press **ENTER** to confirm your decision. If **Yes** was chosen, the pump resets its factory defaults and redisplays the fourth Setup screen. If **No** was chosen, the pump makes no changes to its setup and redisplays the fourth Setup screen.
16.15 Security code

Access to the pump’s Setup menu can be restricted to those who correctly enter a three-digit security code. See 16 Setup.

The code must first be set.

- In the fourth screen of the Setup menu select **Security code** using the **UP** and **DOWN** keys. Press **ENTER** to confirm your choice.
- A screen is displayed inviting the user to set a new code or, if a code is already set, cancel it. Use the **UP** and **DOWN** keys to choose **Set new code** or **Cancel code**. If no code is in place, no option to cancel a code will be displayed. Press **ENTER** to confirm your decision.
- If **Cancel code** is chosen, security protection is removed and the user is returned to the fourth Setup screen.
- If **Set new code** is chosen, the pump displays a screen with three blank spaces for digits and the instruction "Enter new code". Use the **UP** and **DOWN** keys to make your choice of the digits 0-9 for the first digit. Press **ENTER** to confirm. Repeat for the second digit. Repeat for the third digit. The final press on **ENTER** causes the pump to display a similar three-digit entry screen and the instruction "Confirm code".
- Repeat the digit-entry sequence.
• If the second three-digit code entered differs from the first, the pump will briefly display an error message and redisplay the first digit-entry screen.
• If the codes tally, the pump will briefly display a confirmation message and redisplay the fourth Setup screen. Access to the Setup menus is now protected by the new security code.
• If STOP is pressed during code entry, the pump returns the user to the fourth Setup screen. If STOP is pressed during code confirmation, the pump returns the user to the first digit-entry screen.

**Note:** If a code has been set but forgotten, it is still possible to access the Setup screens to cancel the code or reset it to another three-digit number. Contact your supplier or Watson-Marlow Technical support for the bypass sequence.

### 16.16 Exit

- In the fifth screen of the Setup menu Exit is highlighted. Press ENTER.
- The user is returned to the main menu.
17 MemoDose and calibration

Note: This menu area also gives access to flow rate calibration.

Each time the pump is started by pressing START, it records the number of pump-head revolutions which occur until STOP is pressed. The number of revolutions is proportional to the volume of fluid which has been dispensed: the dose. The MemoDose facility allows the user to repeat-dose a precise volume of fluid. To do so, a quantity of fluid must be dispensed as the master dose which the MemoDose facility can repeat exactly or proportionately.

To dispense a master dose

- In the manual mode main screen, set the appropriate pump speed and direction using the UP or DOWN keys and the DIRECTION key. An example is shown here. A slower speed may make it easier for the user to measure accurately - though it may not represent the duty condition.
- Place a suitable measuring vessel under the pump delivery tube.
- Press START. The pump runs and fluid is pumped into the vessel.
- When the required volume of fluid has been dispensed, it is necessary to stop the pump and display the MemoDose screen. This can be achieved in several ways.
  1. Press the STOP key twice within half a second. The pump stops and immediately displays the MemoDose screen.
  OR... 2. Press the STOP key once. The pump stops. (This may make it easier to ensure that the quantity of fluid that has been dispensed is sufficiently precise.) Then press the STOP key twice within half a second. The pump displays the MemoDose screen.
  OR... 3. 620UN, 620U Press the STOP key. The pump stops. Press the MENU key. Use the UP or DOWN keys to select MemoDose. Press ENTER to confirm. The pump displays the MemoDose screen.
  OR... 4, 620SN, 620S Press the MemoDose key
To repeat the dose

- The pump has recorded the number of pumphead revolutions required to dispense the master dose. If the volume of fluid in the measuring vessel is the volume required, press START to repeat the dose.
- If the volume of fluid in the measuring vessel differs from the volume required, the percentage may be adjusted within the limits 1% to 999% of the master dose. Use the UP or DOWN keys to alter the percentage. Press START to dispense the new dose.

The display counts down as the dose proceeds and stops when the dose is complete.
- If STOP is pressed during dosing, the pump stops and returns the user to the MemoDose percentage screen.

Press the STOP key twice within half a second if you wish to exit MemoDose and return to manual operation.

17.1 Changing dosing speed

The user must exit MemoDose in order to change pump speed. After returning to MemoDose, the pump dispenses the previous dose size at the new speed.

- Press the STOP key twice within half a second. The pump displays the manual mode main screen.
- Do not start the pump. Doing so erases the previously recorded master dose and replaces it in the pump’s memory with the current, unmeasured dose. Adjust the speed showing on the display using the UP or DOWN keys.
- Press the STOP key twice within half a second to return to MemoDose. The display shows the previous percentage dose size. The pump will dose at the new speed.

Note: To retain the MemoDose value through a power interruption the pump must be in auto-restart mode. The dosing cycle will resume at the start of a dose and wait for START to be pressed, with the MemoDose percentage screen displayed. See 16.6 Auto-restart.
17.2 Footswitch operation and other remote inputs and outputs with MemoDose

A footswitch can be used to trigger MemoDose dispensing as a hands-free alternative to pressing **START**.

To operate MemoDose with a footswitch, briefly press the footswitch while the MemoDose percentage screen is displayed.

The remote run/stop input is operational. If a dose is interrupted by a remote stop signal, the dose will continue from where it stopped when the state is changed to run.

Remote direction control is disabled. The leak-detection input is operational. All status outputs are operational.

**Note**: The keypad lock feature is particularly useful to prevent inadvertent dose changes while using the MemoDose facility. Keypad lock continues to operate in MemoDose if previously enabled; it can also be enabled while in MemoDose mode. See 14.5 **Keypad lock**.

17.3 Flow calibration

The pump can display flowrate in millilitres per minute as well as speed in revolutions per minute.

- In the manual mode main screen, set the appropriate pump speed and direction using the **UP** or **DOWN** keys and the **DIRECTION** key. A slower speed may make it easier for the user to measure accurately - though it may not represent the duty condition.
- Place a suitable measuring vessel under the pump delivery tube.
- Press **START**. The pump runs and fluid is pumped into the vessel. The volume pumped is not important; but the greater the volume, the more accurate the flow-per-revolution calculation will be. We suggest that the pumphead be run for at least 10 revolutions, and at least 20 when small-bore pumping tube is used.
When a volume of fluid has been dispensed, it is necessary to stop the pump and display the Calibration dose screen. This can be achieved in several ways.

1. Press the **STOP** key twice within half a second. The pump stops and immediately displays the MemoDose/Calibration screen. Use the **UP** or **DOWN** keys to select **Calibration dose**. Press **ENTER** to confirm.

OR...

2. Press the **STOP** key once. The pump stops. (This may make it easier to ensure that the quantity of fluid that has been dispensed is sufficiently precise.) Then press the **STOP** key twice within half a second. The pump displays the MemoDose/Calibration screen. Use the **UP** or **DOWN** keys to select **Calibration dose**. Press **ENTER** to confirm.

OR...

3. **620UN, 620U** Press the **STOP** key. The pump stops. Press the **MENU** key. Use the **UP** or **DOWN** keys to select **MemoDose**. Press **ENTER** to confirm. The pump displays the MemoDose/Calibration screen. Use the **UP** or **DOWN** keys to select **Calibration dose**. Press **ENTER** to confirm.

OR...

4. **620SN, 620S** Press the **MemoDose** key. The pump displays the MemoDose/Calibration screen. Use the **UP** or **DOWN** keys to select **Calibration dose**. Press **ENTER** to confirm.

Measure the volume of fluid pumped. Make a note of the volume.

The pump has recorded the number of pumphead revolutions required to pump the volume of fluid measured.

The calibration dose screen is displayed. It shows a four-digit number of millilitres, and the instruction: "Enter dose value". The number displayed is the number which was entered the previous time the pump was calibrated (or the default figure).

Use the **UP** and **DOWN** keys to enter the measured volume of fluid pumped. Press **ENTER** to confirm.

The pump calculates the volume of fluid pumped for each pumphead revolution. The value from this calculation is saved for use in manual mode displays.

The pump displays a confirmation screen for four seconds, and returns the user to the manual mode main screen, with millilitres per minute shown.

The pump can now display mililitres per minute, revolutions per minute, or both. Press the **START** key while the pump is running to cycle through the three display options.

**Note:** Always recalibrate after changing pump tubes, fluid, or any connecting pipework. It is also recommended that the pump is recalibrated periodically to maintain accuracy.
17.4 Exit

To return to the manual mode main screen select Exit using the UP and DOWN keys. Confirm by pressing STOP.

18 Pin out details

Selecting Pin out details from the main menu causes the pump to display an information screen and then its preset pin and voltage details under 17 headings: Analogue input, Analogue output, Tacho output, Run/Stop input, Direction enable input, Direction input, Leak input, Auto/Man toggle, Dose input, Output 1, Output 2, Output 3, Output 4, Supply voltages, 0 volts availability, Functional earth and Others. No user input is available in this section; it displays information only.

In the main menu, select Pin out details using the UP or DOWN keys and press ENTER to confirm your choice.

The Pin out details menu

The Pin out details menu occupies five screens. The first two are shown here.

To move from one screen to subsequent screens, repeatedly press DOWN. Each item is highlighted in turn until the last item on the screen is highlighted. A further press on the DOWN key displays the next screen of the menu, with the first item highlighted.

Follow the reverse procedure using the UP key to move to an item on a previous screen of the menu.
Make a selection using the **UP** or **DOWN** keys and press **ENTER** to confirm your choice.

The information on pin outs duplicates the details described in this instruction manual under Automatic control wiring.

The screens available are all presented in a similar manner. For example, on selecting **Analogue input**, the following screen is displayed:

![Lower connector diagram](image)

This indicates that the analogue input signal must be applied to pin 4 of the lower D-connector at the rear of the pump, where 0 volts is available on pin 16. If the analogue input is configured for a 4-20mA signal, the maximum permitted voltage is 5 volts; if the analogue input is configured for a 0-10V or 1-5V signal, the maximum permitted voltage is 10 volts.

The information available on selecting **Supply** and **Others** is presented on two screens each. Pressing **DOWN** when the first screen of each is displayed causes the second screen to appear. **UP** performs a similar function.

Pressing **STOP** or **ENTER** in any Pin out information screen returns the user to the appropriate Pin out menu screen.

**To leave the Pin out menu screens**

Cycle through the Pin out menu screens until the fifth screen is displayed. Select **Exit** using the **UP** or **DOWN** keys and press **ENTER** to confirm your choice.

Alternatively ...

Repeatedly press **STOP** to go back level by level until the main menu is displayed.

19 **Exit**

Press **Exit** in the Main menu to return to the Manual mode main screen.
20 Automatic control wiring using the 620N module

Interfacing the pump with other devices is by means of screw-terminal connectors within the 620N watertight module at the rear of the pump. Suitable cable must be passed into the module through one or more watertight cable glands and connected appropriately. The module must be removed to allow this.

It is important to check that the pump’s voltage setting matches the supply. The voltage selection switch is on the rear panel of the drive. The module must be removed (and replaced) to allow it to be checked.

20.1 620N module removal and replacement

To remove the 620N watertight module:

The module is secured to the back of the drive unit by six M5x12 Pozidriv countersunk stainless steel screws.

- Remove the six screws using a suitable crosspoint screwdriver, leaving the top centre screw till last. Even when all screws have been removed, the sealing strip may cause the module to adhere to the drive. If so, a gentle tap will free it. Do not use a tool to lever it off.
- The sealing strip should be retained within its channel on the face of the module. The transparent on/off switch cover should be retained on its flange on the face of the module. Check the integrity of the seal and the transparent on/off switch cover. If either is damaged, it must be renewed to maintain ingress protection.
- If necessary, unplug the two 25-way D-connectors linking the module to the pump drive. If necessary, remove the module’s earth link from the back of the drive. However, the link is long enough to allow the module to fold back to give access to the the circuit board inside and to the back of the drive.
To replace the 620N watertight module:

- Check that the fuse in the fuseholder (ringed) does not need to be replaced.
- Check that the voltage selector switch is correctly set.
- Check that the sealing strip is fully in its channel on the face of the module.
- Attach the module’s earth link wire. Replace and tighten its screw to 2Nm.
- Push home the female (upper) and male 25-way D-connectors.
- Hold the module in place. Do not disturb the seal or pinch the earth link wire or D-connector ribbon cables, and screw in the retaining screws (top centre first). Tighten to 2.5Nm.

Note: The 620N module must be properly fitted using all six screws. Without them, the screw holes may corrode and IP66 (NEMA4X) protection will be compromised.

20.2 Wiring up

It is the user’s responsibility to ensure the pump’s safe and reliable operation under remote and automatic control.

This pump’s 0V lines are commoned and mains transformer-isolated from ground (floating ground). It can be connected to isolated 0V or grounded 0V interfaces.

Cable entry to the module is via up to four watertight cable glands. These may be fitted in place of the plugs which seal the module when the pump is shipped.

The number of glands needed depends on the number of connection cables required and the convenience of the installer. As standard, four M16 cable glands are provided with the pump.

Recommended control cables must be used for the terminal blocks: metric = 0.14sq mm - 2.5sq mm solid and 0.14sq mm - 1.5sq mm stranded. USA = 26AWG - 14AWG solid and 26AWG - 16AWG stranded. Cable: circular. Max/min outside diameter to ensure a seal when passed through the standard gland: 9.5mm-5mm. The cable section must be circular to ensure a seal.
The recommended cable and cable glands must be used for the IP66 (NEMA 4X) version of this pump; otherwise ingress protection may be jeopardised.

For EMC protection, shielded control cable should be used. The shielding should be terminated to one of the pcb mounting screws or to the adjacent spade connection (where fitted).

For improved EMC protection in extremely noisy environments, shielded cable may be used in conjunction with watertight EMC metal cable glands. These must be earthed to the module by adding an M16x1.5 nut with serrated edges to ensure proper contact with the inside of the module. It is necessary to remove the module’s circuit board to access the interior of the module: it is held in place by two fixing screws which can be removed and replaced with a cross-point screwdriver. Take normal anti-static precautions when handling printed circuit boards.

Suitable cables for general-purpose use: 300V with extra premium grade PVC jacket with good flame and moisture resistance.

Suitable cables for industrial use: 300V extra-rugged polyurethane grade jacket with resistance to oils, fuels, solvents and water.

For convenience of wiring more than 8 conductors per cable may be awkward to handle. Only two appear in the illustrations here, for clarity.
• Use a 19mm spanner to unscrew the sealing plug. Discard the nylon sealing washer.
• Screw in one of the supplied M16x1.5 cable glands in place of the plug, using the new nylon sealing washer supplied. Tighten the gland to 2.5Nm to ensure a seal, using a 21mm spanner. If a different gland is used, it must be watertight to IP66.
• Loosen the gland cap (do not remove it) and pass the cable in through the gland. When it has passed through the gland, continue to push the cable through.
• The inside of the module is shaped to guide the cable past the printed circuit board inside. Continued pushing will feed in enough cable to grip inside the module with the fingers.
• Pull through sufficient cable to reach the connectors required. Leave a little slack.
• Strip the outer sheath as necessary and remove 5mm of insulation from the conductors. No tinning or ferrule is required. Note: If very stiff or large-diameter cable is used, it may be convenient to strip the outer sheath before passing the cable’s conductors through the gland. However, to ensure a seal, cable with an undamaged sheath must be present within the gland when it is tightened.
• Twist a suitable length of the cable screen. Loosen one of the pcb retaining screws and wind the shielding round it. Secure the screen by refastening the screw. Alternatively, secure the cable screen to the adjacent spade connection (where fitted).
• Push the bared conductor into the square hole in the connector. When the conductor is fully in, tighten the retaining screw to hold it in place.
• When all conductors are in position, use a 21mm spanner to tighten the gland cap to 2.5Nm to ensure a seal. Alternatively, tighten the gland by hand until it is finger-tight and use a spanner to tighten it further by one-half a turn.

Do not strap the control and mains power cables together.

**620N watertight module pcb connectors:**

![Diagram of 620N watertight module pcb connectors]
Never apply mains power to the terminals within the 620N module. Apply the correct signals to the terminals shown below. Limit signals to the maximum values shown. Do not apply voltage across other terminals. Permanent damage, not covered by warranty, may result. The maximum rating on the relay contacts of this pump is 30V DC; maximum load 30W. Note: Also suitable for low power: ie, 1mA at 5VDC minimum.

20.3 Speed: analogue input

It is possible to control the speed of the pump remotely by one of these methods: a voltage analogue signal within the ranges 0-10V or 1-5V; or a current analogue signal within the range 4-20mA; or a remote potentiometer using the 10V supply at J7.

The analogue process signal must be applied to the i/p terminal of the Analogue 1 connector (J5). Ground to the 0V terminal of the same connector. The pump will provide an increasing flow rate for a rising control signal (non-inverted response) or an increasing flow rate for a falling control signal (inverted response). See 16.2 Analogue in the Setup menu.

4-20mA circuit impedance: 250Ω.

For voltage modes, a stable, reliable voltage source can be used with a DC voltmeter. Circuit impedance: 22kΩ.

Inverting the response is set up in software. Do not invert the polarity of the terminals.

A remote potentiometer with an nominal value of between 1k and 2k with a minimum of 0.25W should be wired between the terminals of the Rem-pot connector (J7) and the i/p terminal of the Analogue 1 connector (J5). When using a remote potentiometer, do not apply a voltage or current control input signal at the same time. The speed control signal will require calibration relative to the minimum and maximum settings of the potentiometer. This is done in software. See 16.1 Trim in the Setup section.

When using a remote potentiometer, it is important to set the analogue input to voltage in the Setup menu. Otherwise the reference voltage supply from the Rem-pot connector will be overloaded and will not provide a full 5V or 10V.
20.4 Speed: analogue output

An analogue voltage output signal is available on the Tacho output connector (J11), between the V terminal and the 0V terminal. The voltage is directly proportional to the pumphead rotation speed. 0V = zero speed; 10V = maximum allowed speed.

There is no mA output on this terminal for the 620UN. This is available on the 620DuN.

20.5 Tachometer frequency output

A tachometer frequency output is available on the Tacho output connector (J11), between the freq terminal and the 0V terminal. It provides a +5V square wave pulse, maximum 0.5mA, the frequency of which is directly proportional to pumphead rotation speed. It provides 5.578 Hz/rpm - 334 pulses per output shaft revolution. The pulse train from the pump can be used to calculate the speed of rotation or to determine the number of pumphead revolutions. This output has the required strength to be effective up to 3m from the pump. Longer cable runs require signal amplification.

Important: general instructions for remote control inputs

All remote control inputs can be wired in two ways:

Logic
A logic voltage between 5V TTL and 24V industrial logic may be wired to the input. The pump is configured to operate without modification anywhere in this range. Any of the 0V terminals - though preferably the 0V terminal associated with the desired input - is connected to the control device’s 0V to make the circuit. Low is equivalent to 0V. High is equivalent to 5V→24V.

Switch
A remote switch may be connected between the input and any positive voltage supply from the pump - though preferably the associated supply terminal. Do not use the 10V supply from the Rem-pot connector, however.
20.6 Run/stop input

Remote run/stop: connect a remote switch between the i/p terminal and the +5V terminal of the Run/stop i/p connector (J4). Alternatively a logic input may be applied to the i/p terminal, ground to the 0V terminal. High input stops the pump, low input runs the pump. With no connection or with the switch open, the pump will default to running. To change or set the sense of the run/stop input, see 16.5 Remote stop in the Setup menu.

20.7 Direction input

To enable remote direction control and disable the DIRECTION (SHIFT, 1) key on the keypad, link the terminals of the Direction enable link connector (J6). Important: Apply no voltage whatever to the Direction enable link. Connect a remote switch between the +5V terminal and the i/p terminal of the Direction i/p connector (J2). Open switch for clockwise rotation, closed switch for counter-clockwise rotation. Alternatively a logic signal may be applied to the i/p terminal and the 0V terminal of the Direction i/p connector (J2). Low input for clockwise rotation, high input for counter-clockwise rotation. With no connection the pump defaults to clockwise rotation.

20.8 Auto / manual toggle input

Connect a remote switch between the +5V terminal and the i/p terminal of the Auto-man i/p connector (J1). Closed switch for automatic control; open switch for manual control. Alternatively a logic input may be applied to the i/p terminal of the Auto-man i/p connector, ground to the 0V terminal. High input for automatic control; low input for manual control.

### 20.9 MemoDose input

Connect a momentary contact switch such as a footswitch or a handswitch between the $5V$ terminal and the $i/p$ terminal of the Dose $i/p$ connector (J3). Close the switch to begin a dose. This input is software-debounced and functions in a similar way to the other remote inputs, such as with $5V$ to $24V$ logic as shown above, using the $i/p$ terminal and the $0V$ terminal. **Note:** This input is software-debounced, so the signal can be either momentary or maintained during the dose. If maintained, the signal must be removed before the next dose.

![Dose i/p terminal diagram](image)

### 20.10 Leak detection input

Connect a remote leak-detection device between the $+12V$ terminal and the $i/p$ terminal on the Tube monitor connector (J9). Closed circuit indicates a leak. Alternatively a logic input may be applied to the $i/p$ terminal, ground to the $0V$ terminal. High input indicates a leak. Connect the cable of a Watson-Marlow Tube monitor leak detector as follows:

<table>
<thead>
<tr>
<th>Tube monitor wire colour</th>
<th>620N module</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blue</td>
<td>J9 0V terminal</td>
</tr>
<tr>
<td>Yellow</td>
<td>J9 i/p terminal</td>
</tr>
<tr>
<td>Red</td>
<td>J9 +12V terminal</td>
</tr>
</tbody>
</table>

Terminate the screen in the 620N module with a 360° EMC gland if required. See 20.2 *Wiring up.*

**Note:** Use only Watson-Marlow 620 series tube monitors.
**Important: pump status outputs**

Outputs 1-4 are available as single-pole change-over relay contacts: Relay 1, 2, 3 and 4. Connect to the normally open or normally closed contacts of the relay as required and configure the pump’s software accordingly. See 16.4 Outputs.

**Note**: The maximum rating on the relay contacts of this pump is 30V DC; maximum load 30W.

**Note**: Also suitable for low power: ie, 1mA at 5VDC minimum.

### 20.11 Outputs 1, 2, 3, 4

**Note**: Relay 1 (J14) is represented here. Relay 2, Relay 3 and Relay 4 (J15, J16 and J17) function identically.

Connect your output device to the c (common) terminal of your chosen relay connector and either the n/c terminal or the n/o terminal (normally closed or normally open) as required. Configure the pump’s software accordingly. See 16.4 Outputs.

By default, Relay 1 is configured to indicate Run/Stop status; Relay 2 is configured to indicate Direction status; Relay 3 is configured to indicate Auto/man status; Relay 4 is configured to indicate General alarm status. See 12 Switching the pump on for the first time.

### 20.12 Supply voltages

An appropriate voltage supply is available where required on each connector. In addition, supplies may be drawn from the Spare supplies connector (J12).

In the table below, "Max load" is the maximum total load on each supply, irrespective of the number of connections.
<table>
<thead>
<tr>
<th>DC Voltage</th>
<th>Max load</th>
<th>Typical use</th>
</tr>
</thead>
<tbody>
<tr>
<td>+5V</td>
<td>10mA</td>
<td>Voltage supply for inputs using remote switch. Possible voltage supply for outputs if only 5V is required.</td>
</tr>
<tr>
<td>+12V</td>
<td>10mA</td>
<td>Possible voltage supply for inputs using remote switch. Possible voltage supply for outputs. Voltage supply for Watson-Marlow Tube Monitor leak detector. Part voltage supply (-12V also needed) for the Watson-Marlow proximity switch.</td>
</tr>
<tr>
<td>-12V</td>
<td>10mA</td>
<td>Part voltage supply (+12V also needed) for the Watson-Marlow proximity switch.</td>
</tr>
<tr>
<td>+10V (from J7)</td>
<td></td>
<td>Reference voltage for remote potentiometer speed control. Do not use as a general supply voltage.</td>
</tr>
</tbody>
</table>

**Note:** All DC supplies are stabilised.
Interfacing the pump with other devices is by means of three D-connectors at the rear of the pump. There are two 25-way D-connectors. The top one is male, the bottom one is female. Mating female and male connectors, screened for EMC compatibility, must be conventionally soldered to screened control cables.

Recommended control cable: 7 strands 0.2mm, 24AWG, screened, circular, up to 25-core. The cable screen should be earthed either through the functional earth pin on the D-connector (pin 1 on the upper (male) 25-way D-connector) (pin 13 on the lower (female) 25-way D-connector), or through the metalwork of the socket or plug.

Do not strap the control and mains power cables together.

The 0V lines on this pump are mains transformer-isolated from ground (floating ground). It can be connected to isolated 0V or grounded 0V interfaces. The TTL (transistor transistor logic) outputs 1 and 2 used here are composed of two states: nominally 0V and 5V; but in practice <0.4V (<16mA) and 2.4-5V (<0.4mA). They are not suitable for driving relays. If a relay is to be driven by the TTL signal, it must be done as described under Logic output 1-4, below.
Never apply mains voltage to the D-connectors. Apply the correct signals to the pins shown. Limit signals to the maximum values shown. Do not apply voltage across other pins. Permanent damage, not covered by warranty, may result.

21.1 Speed: analogue input

It is possible to control the speed of the pump remotely by one of these methods: a voltage analogue signal within the ranges 0-10V or 1-5V; or a current analogue signal within the range 4-20mA; or a remote potentiometer.

The analogue process signal must be applied to pin 4 of the lower D-connector. 0V to pin 16. The pump will provide an increasing flow rate for a rising control signal (non-inverted response) or an increasing flow rate for a falling control signal (inverted response). See 16.2 Analogue in the Setup menu.

4-20mA circuit impedance: 250\(\Omega\).

For voltage modes, a stable, reliable voltage source can be used with a DC voltmeter. Circuit impedance: 22k\(\Omega\).

Inverting the response is set up in software. Do not invert the polarity of the pins.

A remote potentiometer with a nominal value of between 1k and 2k with a minimum of 0.25W should be wired as shown. When using a remote potentiometer, do not apply a voltage or current control input signal at the same time. The speed control signal will require calibration relative to the minimum and maximum settings of the potentiometer. This is done in software - see 16.1 Trim in the Setup section.

When using a remote potentiometer, it is important to set the analogue input to voltage in the Setup menu. Otherwise the reference voltage supply from pin 21 will be overloaded and will not provide a full 5V or 10V.
21.2 Speed: analogue output

An analogue output signal is available as a 0V-10V signal on pin 2 of the lower D-connector. Ground to pin 15. The voltage is fixed and directly proportional to the pumphead rotation speed. 0V = zero speed; 10V = maximum speed.

21.3 Tachometer frequency output

A tachometer frequency output is available on pin 1 of the lower D-connector. Ground to pin 14. It provides a +5V square wave pulse, maximum 0.5mA, the frequency of which is directly proportional to pumphead rotation speed. It provides 5.578 Hz/rpm - 334 pulses per output shaft revolution. The pulse train from the pump can be used to calculate the speed of rotation or to determine the number of pumphead revolutions. This output has the required strength to be effective up to 3m from the pump. Longer cable runs require signal amplification.
Important: general instructions for remote control inputs

All remote control inputs can be wired in two ways:

Logic
A logic voltage between 5V TTL and 24V industrial logic may be wired to the input pin. The pump is configured to operate without modification anywhere in this range. Any of the 0V pins is connected to the control device’s 0V to make the circuit. One 0V pin is identified in the wiring diagram, but any may be used. Low is equivalent to 0V. High is equivalent to 5V → 24V.

Switch
A remote switch may be connected between the input pin and any positive voltage supply from the pump. One 5V supply pin is identified in the wiring diagram but there are several which will do, either 5V or other positive voltage. However, do not use pin 21 on the lower D-connector or pin 20 on the upper D-connector.

21.4 Run/stop input

Remote run/stop: connect a remote switch between pins 7 and 19 of the lower D-connector. Alternatively a logic input may be applied to pin 7 of the lower D-connector, ground to pin 18. High input stops the pump, low input runs the pump. With no connection or with the switch open, the pump will default to running. To change or set the sense of the run/stop input, see 16.5 Remote stop in the Setup menu.
21.5 Direction input

To enable remote direction control and disable the DIRECTION (SHIFT, 1) key on the keypad, link pins 6 and 18 of the lower D-connector. Connect a remote switch between pins 5 and 19 of the lower D-connector. Open switch for clockwise rotation, closed switch for counter-clockwise rotation. Alternatively a logic signal may be applied to pin 5 of the lower D-connector, ground to pin 17. Low input for clockwise rotation, high input for counter-clockwise rotation. With no connection the pump defaults to clockwise rotation.

21.6 Auto / manual toggle input

Connect a remote switch between pins 3 and 18 of the upper D-connector. Closed switch for automatic control; open switch for manual control. Alternatively a logic input may be applied to pin 3 of the upper D-connector, ground to pin 16. High input for automatic control; low input for manual control.
21.7 MemoDose input

Connect a momentary contact switch such as a footswitch or a handswitch between pins 8 and 9 of the lower D-connector. Close the switch to begin a dose. This input is software-debounced and functions in a similar way to the other remote inputs, such as with 5V to 24V logic as shown above, using pin 8 as the input and pin 20 as the 0V (lower D-connector). Note: This input is software-debounced, so the signal can be either momentary or maintained during the dose. If maintained, the signal must be removed before the next dose.

21.8 Leak detection input

Connect a remote leak-detection device between pins 2 and 18 of the upper D-connector. Closed circuit indicates a leak. Alternatively a logic input may be applied to pin 2 of the upper D-connector, ground to pin 15. High input indicates a leak. Connect a Watson-Marlow leak detector in the same way, drawing 12V to power it from pin 21 of the upper D-connector.

Connect the cable of a Watson-Marlow Tube monitor leak detector as follows:

<table>
<thead>
<tr>
<th>Tube monitor wire colour</th>
<th>Pin number upper D-connector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blue</td>
<td>15</td>
</tr>
<tr>
<td>Yellow</td>
<td>2</td>
</tr>
<tr>
<td>Red</td>
<td>21</td>
</tr>
</tbody>
</table>

Note: Use only a Watson-Marlow 620 series tube monitor.
21.9 Pump status outputs

Important: pump status outputs

All four outputs can be configured in software to output a range of parameters: see 16.4 Outputs under Setup.

Outputs 1 and 2 are available simultaneously from the upper and lower D-connectors. The outputs from the lower D-connector operate at 5V TTL only.

All four outputs available from the upper D-connector are open-collector.

By applying a positive voltage to a maximum of 24V to pin 22 of the upper D-connector, all the outputs from this plug are at that voltage: pin 22 is commoned with pins 23, 24 and 25. Care must be taken to ensure that the supply voltage has sufficient capability to drive all the loads applied to all outputs used. Important: The total load of the four logic outputs must not exceed 50mA.

21.9.1 Logic output 1

Output 1 is taken from pin 10 of the upper D-connector, depending on the logic state of the function assigned to Output 1. Alternatively, a load such as a relay coil may be connected to pin 10, ground to pin 17. Current will flow through the circuit depending on the logic state of the function assigned to Output 1. Do not connect to any device requiring more than 50mA.

Additionally, output 1 is available as a 5V TTL logic signal on pin 10 of the lower D-connector. It will change state corresponding to the logic state of the function assigned to Output 1. Do not connect to any device requiring more than 1 TTL load.

By default, output 1 is configured to indicate Run/Stop status. See 12 Switching the pump on for the first time.
21.9.2 Logic output 2

Output 2 is taken from pin 11 of the upper D-connector, depending on the logic state of the function assigned to Output 2. Alternatively, a load such as a relay coil may be connected to pin 11, ground to pin 17. Current will flow through the circuit depending on the logic state of the function assigned to Output 2. Do not connect to any device requiring more than 50mA.

Additionally, output 2 is available as a 5V TTL logic signal on pin 11 of the lower D-connector. It will change state corresponding to the logic state of the function assigned to Output 2. Do not connect to any device requiring more than 1 TTL load.

By default, output 2 is configured to indicate Direction status. See 12 Switching the pump on for the first time.
21.9.3 Logic output 3

Output 3 is taken from pin 13 of the upper D-connector, depending on the logic state of the function assigned to Output 3. Alternatively, a load such as a relay coil may be connected to pin 13, ground to pin 17. Current will flow through the circuit depending on the logic state of the function assigned to Output 3. Do not connect to any device requiring more than 50mA.

By default, output 3 is configured to indicate Auto/Man status. See 12 Switching the pump on for the first time.

21.9.4 Logic output 4

Output 4 is taken from pin 12 of the upper D-connector, depending on the logic state of the function assigned to Output 4. Alternatively, a load such as a relay coil may be connected to pin 12, ground to pin 17. Current will flow through the circuit depending on the logic state of the function assigned to Output 4. Do not connect to any device requiring more than 50mA.

By default, output 4 is configured to indicate General alarm status. See 12 Switching the pump on for the first time.
21.10 Supply voltages

In the table below, "Max load" is the maximum total load on each supply irrespective of the number of connections.

<table>
<thead>
<tr>
<th>DC Voltage</th>
<th>Max load</th>
<th>Lower D</th>
<th>Upper D</th>
<th>Typical use</th>
</tr>
</thead>
<tbody>

<td>-</td>
<td>Reference voltage for remote potentiometer speed control. Do not use as a general supply voltage</td>
</tr>
</tbody>
</table>

Note: All DC supplies are stabilised except the +22.5V.
22 Automatic control and operation

Check that the pump is ready to run before selecting automatic operation. Remote control signals may start the pump without warning.

How to get into auto operation

- Press the AUTO/MAN key to select automatic operation, or apply a high signal (5V to 24V) to the remote auto/manual input.
- The pump responds to the analogue signal as soon as this is done and shows the "AUTO" icon. In this mode the pump is automatically switched into auto-restart mode and displays the ! icon. The only keys active are STOP, AUTO/MAN and DIRECTION.
- If the remote direction input is active and the direction-enable link is applied, the DIRECTION key is disabled. If keypad lock is set, only STOP is active.
- The pump displays whichever of two auto running screens is appropriate according to the previously selected auto mode - 4-20mA or 0-10V.
- The auto running screens display four pieces of information: the speed at which the pump will rotate after receiving a low signal (4mA or 0V); the speed at which the pump will rotate after receiving a high signal (20mA or 10V); the set speed (that is: the speed at which the pump is currently rotating according to the analogue speed signal); and the flowrate in millilitres per minute.
- The pump also responds to remote digital inputs. If the run/stop input stops the pump, the bottom line of the auto running screen shows "Remote stop". When it starts the pump again, this will disappear and the pump returns to normal running mode.
- Direction can be changed remotely in this mode.
- If the pump is stopped because a leak is detected, the screen displays "LEAK DETECTED. Check and reset, then press Stop". See 23.1 Error codes.
- The remote status outputs operate fully in this mode.

How to get out of auto operation

- Press the AUTO/MAN key or make the remote auto / manual input go low (0V). The pump returns to manual operation and retains the set speed and run status from its previous operation in analogue mode.
In an emergency press the **STOP** key. The pump stops and displays an interruption screen.

- If keypad lock is in place when **STOP** is pressed, or if the pump is in auto mode via the digital input, the interruption screen offers one key-press: press **START** to continue auto operation.
- If keypad lock was not in place when **STOP** was pressed, the interruption screen offers a choice: **Continue** to continue auto operation, or **Manual** to switch to manual mode. Use the **UP** and **DOWN** keys to choose and press **ENTER** to confirm.
If the pump display remains blank when the pump is on, make the following checks:

- Check the position of the voltage selector switch at the rear of the pump.
- Check the mains power switch at the rear of the pump.
- Check that mains power is available to the pump.
- Check the fuse in the fuseholder in the centre of the switchplate at the rear of the pump.
- Check the fuse in the mains power plug if one is present.

If the pump runs but there is little or no flow, make the following checks:

- Check that the tube and rotor are in the pumphead.
- Check that fluid is supplied to the pump.
- Check that the tube is not split or burst.
- Check for any kinks or blockages in the lines.
- Check that any valves in the lines are open.
- Check that the correct wall-thickness tube is being used.
- Check direction of rotation.
- Check that the rotor is not slipping on the drive shaft.
## 23.1 Error codes

If an internal error occurs, a flashing error screen is displayed. **Note:** Signal out of range, Over signal, No signal and Leak detected error screens report the nature of an external signal. They do not flash.

<table>
<thead>
<tr>

24 Drive maintenance

There are no user serviceable parts inside the pump (except the power cable: see 10 Connecting this product to a power supply). The unit should be returned to Watson-Marlow or its appointed agents or distributors for service.

25 Drive spares

| Replaceable main fuse, type T5A H 250V: FS0043 | Foot: MR3002M x 5 |
26 620RE MarkII, 620RE4 MarkII and 620R MarkII pumpheads

Note: MarkII pumpheads differ from MarkI pumpheads as follows: they have a new guard-switching arrangement which is not compatible with 623/624 drives. Similarly, older guards are incompatible with 620 drives. Elsewhere in this manual, the term "MarkII" is omitted.

26.1 620RE, 620RE4 and 620R key safety information

Before opening the pumphead guard please ensure that the following safety directions are followed.

- For close-coupled drives, ensure that the pump is isolated from mains voltage.
- Ensure that there is no pressure in the pipeline.
- If a tube failure has occurred, ensure that any product in the pumphead has been allowed to drain through the controlled waste to a suitable drain.
- Ensure that protective clothing and eye protection are worn if hazardous products are being pumped.

26.2 620RE, 620RE4 and 620R safe-guarding

- Primary safety on 620 series pumps is provided by the tool-lockable pumphead guard. Secondary (backup) protection is provided in the form of an electrical guard switch which stops the pump if the pumphead guard is opened. The electrical guard switch on cased pumps should never be used as primary protection. Always disconnect the mains power supply to the pump before opening the pumphead guard.
26.3 620RE, 620RE4 and 620R
pumping conditions

Pressure and viscosity

- All pressure values in this operating instruction, from which performance and life figures have been calculated, relate to peak pipeline pressures.
- Although rated to 4 bar peak pressure, this pump will generate in excess of 4 bar peak pressure if pipeline restrictions are in place. In instances where it is critical that a peak pressure of 4 bar is not exceeded, pressure relief valves should be installed in the pipeline.
- For pumping duties of 2-4 bar pressure, fit hard Marprene/Bioprene or standard Sta-Pure or Chem-Sure tube elements. "M" or "P" in the tube element’s product order code denotes suitability for higher pressure use.
- For pumping duties of 0-2 bar pressure, use standard hardness elements or the standard range of continuous peristaltic pump tubing.
- Viscosity handling is maximised by using hard Marprene/Bioprene or Sta-Pure tube elements in the pumphead.
- Ensure that there is always a minimum of one metre of smooth bore flexible tubing connected to the discharge port of the pumphead. This will help minimise any impulse losses and pulsation in the pipeline. This is especially important with viscous fluids and rigid pipework.

26.4 620RE, 620RE4 and 620R
pump installation

A correctly engineered installation will promote the best possible tube life, so please ensure that the following guidelines are followed:

- Avoid tight pipeline bends, pipe reducers and excessive lengths of smaller bore tubing than that in the pumphead, particularly in pipelines on the suction side.
- Ensure that connecting pipe work and fittings are suitably rated to handle the predicted pipeline pressure.
- If rigid pipe work comes in close proximity to the pumphead, a drop out section of pipe work will simplify tube replacement.
- Ensure that the controlled waste blanking plug is in position if the controlled waste port is not in use. See below.
- It is advisable to use controlled waste pipe work if pumping hazardous, aggressive or abrasive fluids or products which will harden in contact with air.
Connect waste pipe work to the waste port using the coupling adaptor supplied. Push out the blanking plug. Drop the threaded waste fitting into place. Secure it with the supplied locking nut. Fully tighten by hand. Ensure that there is adequate clearance underneath the pumphead. Waste pipe work should run to a suitable container or drain. The leak detector installation procedure is included in the leak detector kit. If unsure of an installation please contact your local Technical Support Office.

26.5 620RE, 620RE4 and 620R
general operation

Always isolate the pump from the mains power supply before opening the guard or performing any positioning, removal or maintenance.

Opening the pumphead guard

Unlock the guard with the 5mm Allen key provided (or a screwdriver). Open the guard to its full extent. This creates the maximum clearance between the tube ports and guard to remove the tubing.

Engaging/disengaging the rollers

The extent of travel of the roller release levers is clear from pictures 2 and 3 above. Do not try and force the levers beyond their normal extent of travel as this will damage the rotor. To engage the rollers snap the roller release levers counter-clockwise making sure that the rollers lock out against the tubing. To disengage the rollers, snap the release levers clockwise to their disengaged position. For high pressure tubing elements or four roller pumpheads, a 5mm Allen key can be used to aid leverage when engaging/disengaging the rollers with the release levers.

Make sure that fingers are clear of the rollers and the front face of the rotor hub when using the roller release levers.
Pre-load checks

- Before loading tubing, ensure that all rollers rotate freely, that the tube ports and location grooves are clean and that if in use, the controlled waste pipe work is free of any obstructions.

Closing the pumphead guard and start-up

- Ensure that the guard seal is clean, replacing it if necessary.
- Ensure that the rollers are engaged and locked out against the tubing
- Close the guard and push it against the track until the latch engages.
- Connect suitable pipe work to the pumphead using the appropriate connectors for the tube element. See below.

26.6 620RE and 620RE4 tube element loading

Always isolate the pump from the mains power supply before opening the guard or performing any positioning, removal or maintenance.

620RE element pumpheads are factory set to accept Watson-Marlow LoadSure tube elements. Pumping performance will be adversely affected if LoadSure elements are not used.

- Open the guard using a suitable screwdriver or a 5mm Allen key. Disengage the rollers.
- Locate one of the "D"-shaped flanges into the lower port. (The "D" flange ensures that the element can only be loaded correctly).
- Wrap the tube element around the disengaged rollers of the rotor.
- Locate the second "D"-shaped flange into the upper port.
- Ensure the flat face of each "D" flange sits flush to the flange sealing face of the track.
- Engage the rollers.
- Close the guard and push it against the track until the latch engages.
Connecting LoadSure elements to supply and discharge tubes

LoadSure sanitary elements - which have white connectors - are connected to a tubing system using Tri-clamps and EPDM gaskets.

- Hold the connector end of the supply or discharge tube against the element connector, with an EPDM gasket between them.
- Use a Tri-clamp to engage both flanges squarely, close it and tighten.

LoadSure industrial elements - which have black connectors - are connected to a tubing system using cam-lock (cam and groove) fittings.

- Push the female fitting over the element connector.
- Pull both cam levers closed until they engage.
26.7 620R continuous tube loading

- 620R continuous tubing pumpheads are factory set to accept Watson-Marlow 600 series 3.2mm wall tubing. Pumping performance will be adversely affected if Watson-Marlow tubing is not used.
- Select the tube clamp set which is correct for the tubing size to be used.
- Locate the two “U”-shaped track clamp halves into the pumphead ports (The “U”-shape ensures correct loading).
- Locate the corresponding guard clamp halves which have raised “T” locating sections, into the slots on the inner guard face above and below the guard hinge. Push and slide into their locked position.
- Closing the guard will align the two halves of the clamp around the tubing.
- Disengage the rollers.
- Locate one end of the tubing into the lower port “U” clamp and hold firmly in position.
- Wrap the tubing tightly around the retracted rollers, making sure that there is no twisting through its length.
- Locate the other end of the tubing into the upper port “U” clamp.
- Hold both ends of the tubing in one hand maintaining tension around the retracted rollers.
- Engage the rollers.
- Close the guard and push it against the track until the latch engages.
- Ensure that continuous tubing is not loosely clamped at the pumphead ports.
- Ensure that when the pump is re-started all of the rollers have re-engaged. A roller which has not re-engaged will “click” continuously. No damage will occur if this happens but the roller should be re-engaged manually using the 5mm Allen key. See 23 Troubleshooting.
26.8 620RE, 620RE4 and 620R
tube element or continuous tube removal

Always isolate the pump from the mains power supply before opening the guard or performing any positioning, removal or maintenance.

- Unlock the guard and disengage the rollers.
- Disconnect the tubing from the external pipeline.
- Remove the tubing from the pumphead.

26.9 620RE, 620RE4 and 620R
maintenance

Scheduled maintenance

- The stainless steel pumping rollers run on sealed bearings and do not require lubrication.
- Remove the rotor and lubricate the follower rollers and roller engaging mechanisms with a lithium-based grease. This should be carried out every six months for intermittent duties and every three months for 24 hour duties.
- If fluid is spilled inside the pumphead, flush the pumphead out with water and mild detergent as soon as possible. If specific cleaning agents are required to clean the spillage, please consult Watson-Marlow Technical Support Office before proceeding, in order to confirm chemical compatibility.
- If the rotor needs to be removed, refer to the guidelines below.

Roller adjustment

620 pumpheads have provision for adjustment to reset the roller/track gap to compensate for wear after extended service in arduous applications.

Roller/track gaps can only be accurately judged without tubing in the pumphead. The gap should be 4.6mm for 3.2mm wall tubing and 5.5mm for LoadSure elements.

If the gap is more than 0.2mm greater than these dimensions, the following may be carried out:
- Note the number on the roller arm to which the engraved line on the hexagon-headed main roller pin corresponds.
- Remove the circlip (snap-ring) and roller pin.
- Relocate the main roller pin, resetting the engraved line to one number lower. For example, if the engraved line was at "-1", reset it to "-2" to reduce the roller track gap.
- Ensure the roller pin is correctly seated into the roller arm thrust washer. Replace the circlip.
Rotor removal

- Remove the rotor cover by hand and the central locating bolt using a 5mm Allen key. Pull the rotor off the keyed shaft. Do not use tools to lever the rear face of the rotor away from the inner face of the track: it should come off by hand.

Track removal

- Remove the rotor as described above.
- Disconnect the waste pipework (if attached).

- Loosen the two track retaining screws using a suitable screwdriver.
- Withdraw the track fully from the gearbox.
- After removing the rotor and track, it is advisable to remove the metal key from the keyway, clean and reassemble. The key fits its keyway tightly. It may be freed by tapping gently with a screwdriver or other suitable tool.
Track re-location

- Ensure that the track is clean.
- Align the track so that the location holes are aligned with the threaded holes in the cased drive.
- Tighten the two track retaining screws using a suitable screwdriver.
- Re-connect the waste pipework (if required).

Note: The track can be fitted in two positions: with ports to the right or with ports down. The ports-down position requires that the pump is positioned at the front of the surface it stands on to provide clearance for the supply and discharge tubes.

Rotor re-location

Before replacing the rotor, locate the key into the driveshaft keyway and apply a thin layer of grease over the shaft and key. The rotor keyway is the largest of the four slots radiating from the driveshaft socket: the top one in the first picture, above. Align the rotor keyway with the shaft key and slide the rotor into position, ensuring that a positive “stop” is achieved and ensure that the full length of the drive shaft is fitted into the rotor.
- Do not force the rotor into position. The rotor will slide into place easily if correctly aligned.
- Secure the rotor with the hexagonal locating bolt (complete with washer) to a nominal torque of 10Nm using a 5mm Allen key.
- The rotor bolt, which is impregnated with “Loctite 218” thread lock, should be subjected to a maximum of three removals/relocations before renewal. To avoid rotor bolt renewal after three removals, apply “Loctite 222” thread lock to the rotor thread before relocation. This is critical to ensure prolonged, secure location of the rotor hub to the drive shaft. Failure to complete this action will invalidate the terms and conditions of the warranty.
- Replace the rotor cover.

When closing the guard, check it does not make contact with the rotor. If it does, the rotor has been fitted incorrectly. Re-open the guard, remove and refit the rotor, and close the guard.
26.10 620RE, 620RE4 and 620R
CIP and SIP

General

- Unlock the guard and disengage the rollers within the tube zone.
- Close the guard and squeeze against the track until the latch clicks.
- Observe a 1m safety area.

CIP

- LoadSure tube elements and continuous tubing can be cleaned using CIP processes.
- Ensure that the tubing material is chemically compatible with the cleaning agent that is to be used.
- If cleaning agents are spilled over the pumphead, wash down immediately.
- Ensure that controlled waste pipework is fitted to allow a safe release of cleaning agent in the event of a tube failure.

SIP

- Only STA-PURE tube elements can be used in a steam in place sterilisation processes.
- STA-PURE tubing elements can be sterilised to 3A Class two and FDA minimum recommended standard which is 121C (250°F) at 1bar (14.5 psi) saturated steam for 20 minutes.
- Monitor the process continuously.
- If a tube failure occurs, shut down the process. Do not touch the pumphead until a 20 minute cooling period has been observed.
- Ensure a 20 minute acclimatisation period is observed before running the pump following SIP.
- Ensure that controlled waste pipework is fitted to allow a safe release of steam in the event of a tube failure.
- Ensure a 1m safety zone is maintained around the pumphead during SIP cycles.

Ensure that the pumphead door is closed and locked before SIP cleaning commences.

27 620RE, 620RE4 and 620R performance data

Pumping conditions

All performance figures in this operating instruction have been recorded against peak pipeline pressures.

This pump is rated to 4 bar (58psi) peak pressure when fitted with a 620RE or 620RE4 pumphead using high-pressure tubing. However, it will generate in excess of 4 bar (58psi) peak pressure if the pipeline is restricted. Where it is important that 4 bar (58psi) is not exceeded, pressure relief valves should be installed in the pipeline.

Viscosity handling is maximised by using 4.0mm wall LoadSure elements with the 620RE and 620RE4 pumpheads.

Flow rates are normalised test values obtained using new tubing with the pumphead rotating clockwise pumping water at 20°C with negligible inlet and discharge pressures. Actual flow rates achieved may vary because of changes in temperature, viscosity, inlet and discharge pressures, system configuration and tubing performance against time. Flow rates may also vary due to normal manufacturing tolerances of the tubing. These tolerances will make flow rate variance more pronounced at smaller bore sizes.

For precise and repeatable performance it is important to determine flow rates under operating conditions for each new piece of tubing.

620R family pumpheads’ flow rates are directly proportional to rotor speed. If you wish to run the pump at a speed not shown in the tables below, flow figures can be reached by dividing the maximum flow shown in the tables below by the maximum rpm figure, and multiplying the result by your required speed in rpm.

In normal circumstances, rotor and tube life are maximised if the pumphead is run slowly, particularly when pumping at high pressure. However, to maintain performance at pressures above 2 bar, avoid running the pumphead below 50 rpm. If low-flow, high-pressure operation is necessary, switching to a smaller tube is recommended.

Sta-Pure and Marprene TM tubing are hard to compress when new. When using tubing made of these materials, the first five pumphead revolutions should be at a speed of 10rpm or greater. If the pump is run slower, the safety system built into pump drive’s software may cause it to stop and display an over-current error message.

Note: Flow rates quoted have been rounded for simplicity, but are accurate to within 5% - well within the normal tubing tolerance variation of flow rate. They should therefore be taken as a guide. Real flow rates in any application must be determined empirically.

### 34 Decontamination certificate

In compliance with the UK Health and Safety at Work Act and the Control of Substances Hazardous to Health Regulations, you are required to declare the substances which have been in contact with product(s) you return to Watson-Marlow or its subsidiaries or distributors. Failure to do so will cause delays. Please ensure that you fax us this form and receive an RGA (Returned Goods Authorisation) before you despatch the product(s). A copy of this form must be attached to the outside of the packaging containing the product(s). Please complete a separate decontamination certificate for each product. You are responsible for cleaning and decontaminating the product(s) before return.
